PART-A

Definition: - Bar Bending Schedule (BBS)

In Civil Engineering Bar Bending Schedule is the important part of Estimation chart. In the Bar Bending schedule provides the reinforcement (steel) calculation for reinforcement of concrete column, beam and slab cutting length and also use to find the types of bends of length which we provide in steel structures.

This process of listing the location, type and size, number of and all other details is called “Scheduling”. In context of Reinforcement bars, it is called bar scheduling. In short, Bar Bending Schedule is a way of organizing rebars for each structural unit, giving detailed reinforcement requirements.

BBS is used in finding cutting length of steel and total weight of steel per unit area. and we can make the bar bending schedule in MS-Excel.

General Procedure to be followed in Preparing BBS

- ✚ The bars should be grouped together for each structural unit, e.g. beam, column, Footing etc.
- ✚ In a building structure, the bars should be listed floor by floor or according to need.
- ✚ For cutting and bending purposes schedules should be provided as separate A4 sheets and not as part of the detailed reinforcement drawings.
- ✚ It is preferable that bars should be listed in the schedule in numerical order.
- ✚ It is essential that bundle of bars refers uniquely to a particular group or set of bars of defined length, size, shape and type used on the job.

Advantages of Bar Bending Schedule

- ✚ Cutting Length & Bending of Reinforcement Bar can be done.
- ✚ Bar Bending Schedule avoids wastage of steel reinforcement (5% to 10%) & thus saves project cost.
- ✚ Bar Bending Schedule provides Better Estimation of reinforcement Steel requirement for each and every Structure Member
- ✚ it is very much useful during Auditing of Reinforcement & provides check or Theft & misappropriation.
- ✚ It enables easy and fast preparation of Bills of construction work for clients & contractors.

Why Steel is Used in Concrete

Reinforced concrete is a composite material made up of Plain Concrete reinforced with rebars i.e. Reinforcing Bars. Plain Concrete possesses very good compressive strength but is weak in tensile strength. As a result, a plain concrete beam fails suddenly as soon as the tension cracks start to develop due to load.

Hence in order to avoid failure of plain concrete it should be provided with tensile strength. This is possible by inducing rebars into plain concrete. Hence, it is reinforced (i.e. embedded) with rebars.

The reinforcement bars transfer load between the concrete and rebar. The direct stress (tensile/pull or compressive/push) transfer takes place from concrete to rebar interface by means of bond between them i.e. due to friction

As rebars impart tensile strength to concrete, metals used for rebars should possess good tensile strength. This will avoid cracking of concrete in tension. Though there are many metals like Aluminum, Cast Iron, copper available for reinforcing concrete, Steel is most widely used as reinforcing material in reinforced concrete. It is because the thermal Expansion coefficient of both materials are approximately same so the bonding between concrete and steel is more.

What is TMT BAR

TMT bars or Thermo-Mechanically Treated bars are high-Strength Reinforcement bars having a tough outer core and a soft inner core. The very first step of the manufacturing process involves passing the steel wires through a rolling mill stand. Thereafter, these rolled steel wires are again passed through the Temp core water cooling system. While passing the wires through the water-cooling system, the water pressure is optimized. The sudden quenching and drastic change in temperature toughen the outer layer of the steel bar, thus making it super tough and durable. Once this process is over, the TMT bars are subject to atmospheric cooling. This is done in order to equalize the temperature difference between the soft inner core and the tough exterior. Once the TMT bar cools down, it slowly turns into a ferrite-pearlite mass. The inner core remains soft giving the TMT bar great tensile strength and elongation point.

This design is unique to the TMT bars and gives superior ductility to the bars. Also, this unique manufacturing technique and the absence of Cold stress make this bar corrosion- resistant and boost its weld ability

ADVANTAGES OF TMT BARS

- Higher strength with better elongation
- Excellent Weld-ability
- Resistance to fire hazards
- Excellent Ductility
- Higher Fatigue Strength
- Easy workability at site
- Better Bonding Strength
- Better Corrosion Resistance
- Achieves better results than BIS Standards

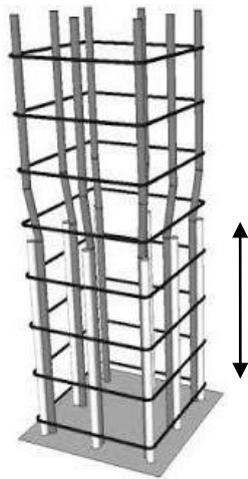

Overlap Length / Lap Length in Reinforcement

The standard length of Rebar is 12m. Suppose the height of the column is 20 m. To purvey this requirement, two bars of length 12m and 8m are overlapped (joined) with overlap length.

Overlap Length for compression members (columns) = $50d$

The Overlap Length for tension members (beams) = $40d$

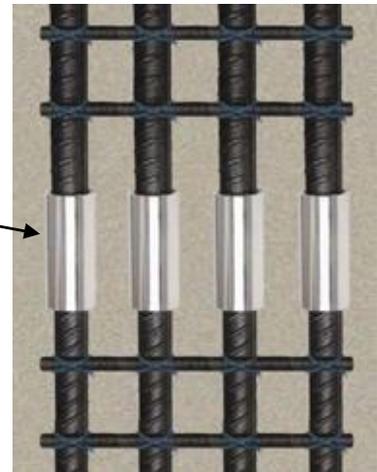

[d is the Diameter of the bar]

Overlap Length in
Compression $50D$

REBAR
COUPLER

Results of the study reveal that the use of **rebar couplers** in place of **lapping** is considerably cost effective for larger diameter bars such as 32 or 40 mm bars. Other than the cost, the other obvious advantage of **couplers** is avoiding congestion of **rebars** which may occur at a lap zone, now a day mostly use coupler in construction.

What is clear cover in concrete

The Clear Cover is the Distance measured From the Exposed concrete Surface (without Plaster and Other Finishes) to the nearest Surface of reinforced bar.

They were made up of 1:3 ratio of cement mortar. Cover block should be immersed in water for 14 days to get the maximum strength. All the beams, column, slab, were checked to ensure adequate cover blocks are provided to the bottom and sides of the reinforcement. Main bars of the columns were adjusted to ensure the covering requirements before concreting. Chair of correct height were used to maintain the require gap between top and bottom reinforcement nets and cover blocks were also provided to bottom reinforcement

Clear Cover to Main Reinforcement

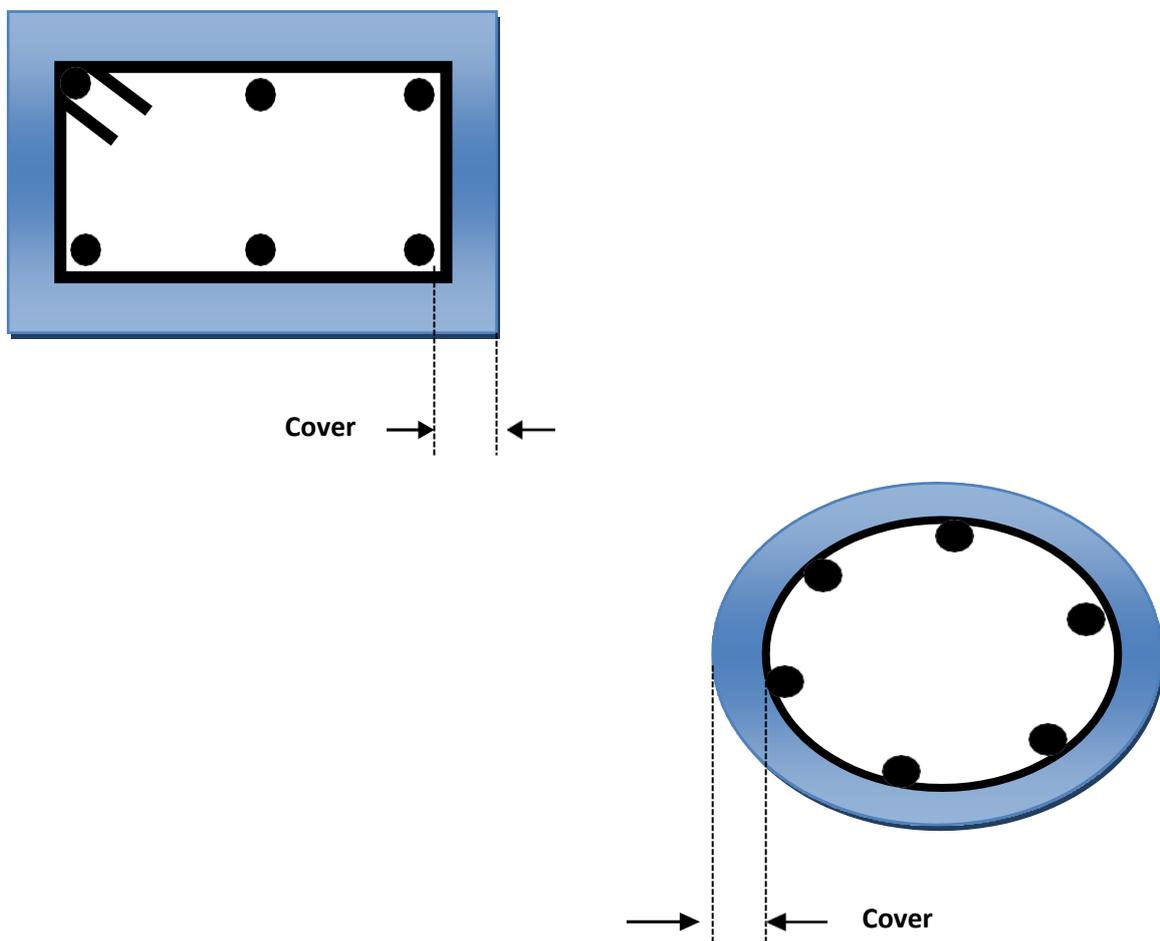

Footing	50mm
Raft Foundation Top	50mm
Raft Foundation Bottom/Side	75mm
Strap Beam	50mm
Grade Slab	20mm
Column	40mm
Shear Wall	25mm
Beams	25mm
Slabs	15mm
Flat Slabs	20mm
Staircase	15mm
Retaining Walls	20/30mm
Water Retaining Structures	20/30mm

In the design of reinforced concrete structures, the reinforcement provided is embedded in the concrete up to a particular distance from the face of the member because of the following main reasons:

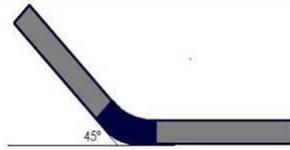

- To provide protection to reinforcement from corrosion.
- To provide fire resistance to reinforcement.
- To provide sufficient embedded depth so that reinforcement develops the requisite stress.

This distance is measured in different ways and known by different names:

1. **Clear cover:** This is the distance from the face of the member to the outermost face of the reinforcement including shear or torsion Stirrups or links.
2. **Nominal cover:** This is the same thing as clear cover albeit with a different name. This term is used by the code. It is the distance measured from the face of the member to the outermost face of the reinforcement including Stirrups or links. It is the dimension shown in drawings and detailing.
3. **Effective cover:** This is the distance measured from the face of the member to the center of area of the main reinforcement, that is tension or compression reinforcement. This is the dimension usually used for design calculations

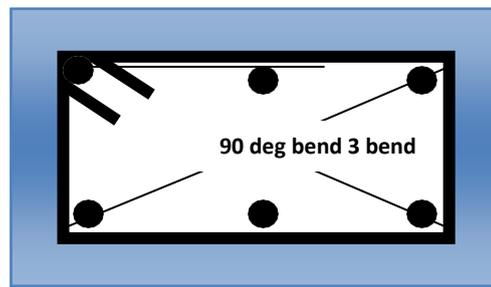

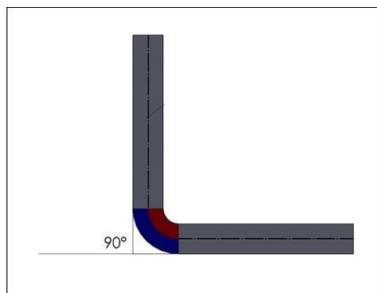

How much bend deduction we take on turning of reinforced bar at 45° 90° 135° & 180°

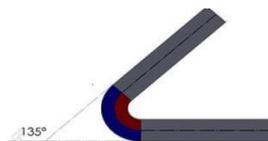

At 45 Degree, Bend Elongation is 1d. Where “d” is Dia. Of Bar

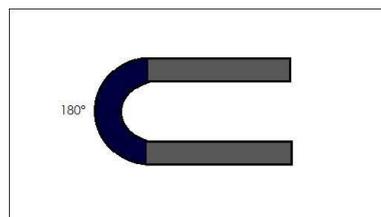

135 deg bend 2 bend

At 90 Degree, Bend Elongation is 2d. Where “d” is Dia. Of Bar

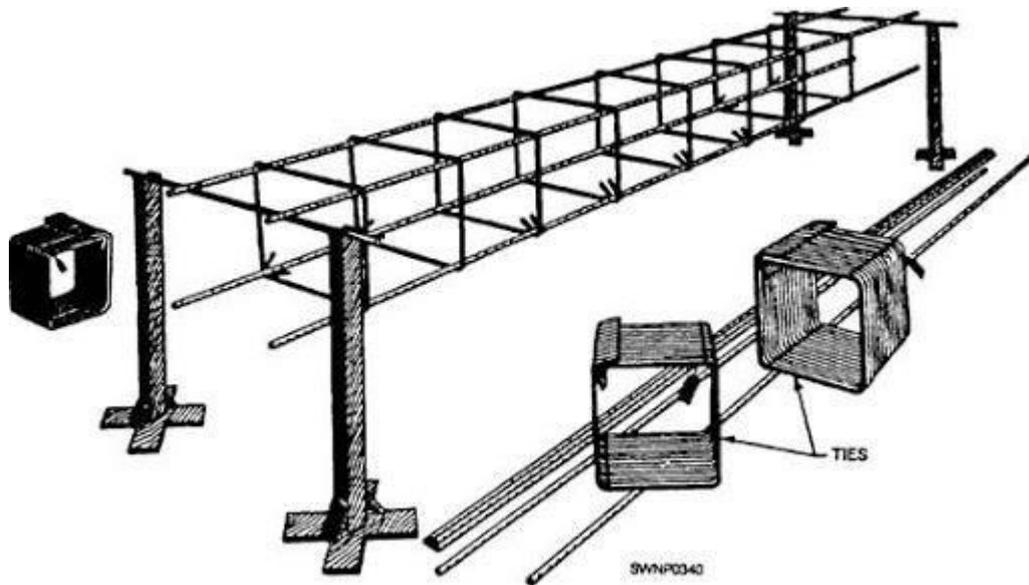

At 135 Degree, Bend Elongation is 3d. Where d is Dia. of Bar

At 180 Degree, Bend Elongation is 4d. Where d is Dia of bar

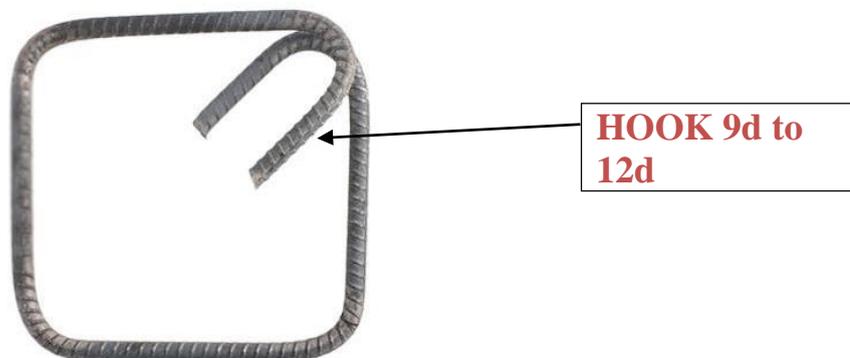

How much does hook length take in a Ring

Remember,

The transverse reinforcement provided in Column is called **Ties** and the transverse reinforcement provided in Beam is called **Stirrups**. But on-site, we usually call both transverse reinforcements as Stirrups.

In General Hook Length Varies According to IS CODE is 9d to 12d

Bar Bending Schedule Part - B

Diameter of Reinforcement Bar Availability

Steel bars does not vary according to the structure. They vary according to loading conditions imposed on the structure. What-ever the structure it is Footing, Raft, Columns, Beam and Slab The most commonly used bars and available in shelf at all times are **6mm, 8mm, 10mm,12mm,16mm,20mm,25mm** are available easily outside also. In most of the buildings we use max 25mm. only in some places 32mm also available. greater dia. like 64mm and 128mm has to be ordered specially from steel plant for manufacturing unit.

Diameter of Reinforcement bar in mm For MKS Measurement	Diameter of Reinforcement bar in inch For FPS Measurement
<ul style="list-style-type: none"> • 6 mm • 8mm • 10mm • 12mm • 16mm • 20mm • 25mm • 28mm • 30mm • 32mm • 36mm 	<ul style="list-style-type: none"> • #3(3/8") • #4(1/2") • #5(5/8") • #6(3/4") • #7(7/8") • #8(1") • #9(9/8") • #10(10/8")

Standard Length of the Steel Bar In Meter (MKS) (Bars are sold at standard Length)	Standard Length of the Steel Bar In Feet (FPS) (Bars are sold at standard Length)

Formula to Find Weight of Bar in Meter	Formula to Find Weight of Bar in Feet
<p>Weight Per Meter = $D^2/162$ (Note Dia Should be in mm)</p> <p>For Example</p> <p>If Diameter of bar=$D=8\text{mm}$</p> <p>Weight Per Meter = $W = (8 \times 8)/162 = .395\text{Kg/M}$</p> <p>If Diameter of bar=$D=10\text{mm}$ Weight Per Meter $W = (10 \times 10)/162 = .617\text{Kg/M}$</p>	<p>Weight Per Feet = $D^2/24/2.204$ (Note Dia Should be in #)</p> <p>For Example</p> <p>If Diameter of bar=$D= \#4$</p> <p>Weight Per Feet $W = 4 \times 4/24/2.204 = .302\text{KG/FT}$</p> <p>If Diameter of bar=$D= \#6$ Weight Per Feet $W = 6 \times 6/24/2.204 = .680\text{ KG/FT}$</p>

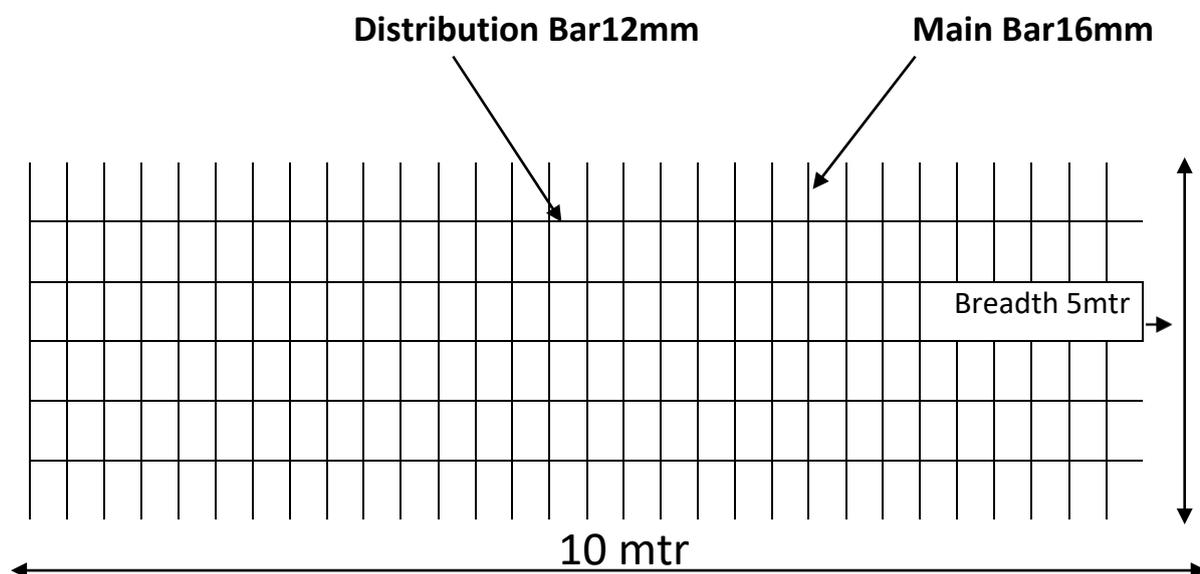

Formula to Find Weight of Per Bar in Meter	Formula to Find Weight of Per Bar in Feet
<p>For Example</p> <p>If Diameter of bar=$D=8\text{mm}$</p> <p>Weight per Bar= $w = (8 \times 8)/162 \times 12\text{M/rod} = 4.74\text{kg/Bar}$</p>	<p>For Example</p> <p>If Diameter of bar=$D= \#4$</p> <p>Weight Per Feet $W = 4 \times 4/24/2.204 \times 40 = 12.10\text{KG/Bar}$</p>

Mostly we Calculate in all process in MKS System because More Accuracy is found in the MKS System.

Procedure to Find Cutting Length of Main Bar or Distribution Bar in mesh :-

Main Bar: The Main Bar in Reinforced Concrete Structures is the Reinforcement Provided in the direction in which Moment is very high or dominates.

- ✚ Main Reinforcement Bar is normally used at the bottom of the slab.
- ✚ Higher Dimension Bar is used as Main Reinforcement. (12/16 mm)
- ✚ Main Reinforcement Bar is used to transfer the bending moment to beam.

Cutting Length Of Distribution Bar With Hook:

9d hook →

Length of hook = $9d$ where d is the diameter of bar. if both side Providing then

Total Length of Distribution Bar = $L + 9d(\text{one side}) + 9d(\text{another side}) - (2 \times 90^\circ \text{bend})$

Now for example. Dia of bar " d " = 12mm

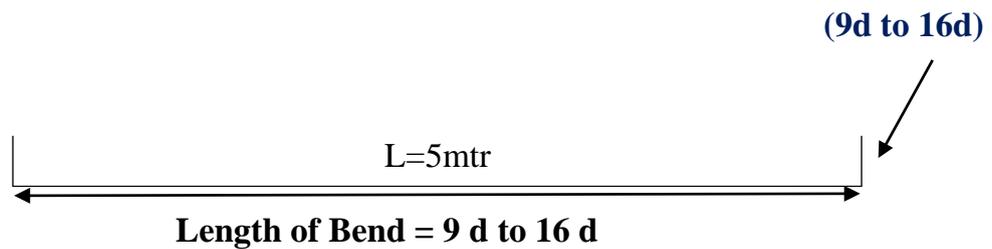

So $9d = 9 \times 12 = 108\text{mm}$ we Convert into Meter $(108/1000) = .108 \text{ mtr}$

For bend $(2 \times 2 \times d) = (2 \text{ No.} \times 2 \times 12) = 48\text{mm} = (48/1000) = .048 \text{ mtr}$

Total Length of Distribution Bar = $10 + (9d) + (9d) - \text{bend}$

$$= 10 + .108 + .108 - .048 = \mathbf{10.168 \text{ mtr}}$$

Cutting Length Of Main Bar With Bend : if Bend Providing Both Side

Where d is the Diameter of bar.

$$\text{Total Length of Main Bar} = L + 10d + 10d - (2 \times 2d)$$

Now For Example, $d = 16\text{mm}$ then

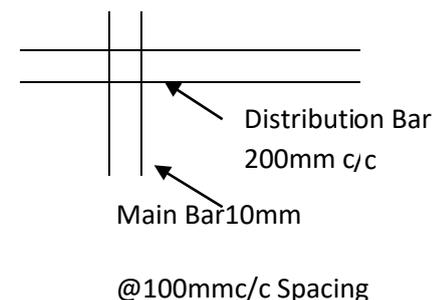

So $10d = 10 \times 12 = 120\text{mm}$ We convert into meter $(120/1000) = .120 \text{ mtr}$

For bend $(2 \times 2 \times d) = (2 \text{ No.} \times 2 \times 16) = 64\text{mm} = (48/1000) = .064 \text{ mtr}$

$$\begin{aligned} \text{Total Length of Main Bar} &= 5 + .120 + .120 - .064 \\ &= \mathbf{5.176 \text{ mtr}} \end{aligned}$$

Number of Distribution Bar (12 mm) in mesh.

$$\begin{aligned} \text{Number of Dist. Bar} &= \frac{\text{Width of mesh}}{\text{Spacing of Dist.bar}} + 1 \\ &= \frac{5000}{200} + 1 \\ &= \frac{2900}{200} + 1 \\ &= 25 + 1 = \mathbf{26 \text{ Nos.}} \end{aligned}$$

Number of Distribution Bar(12 mm) in mesh.

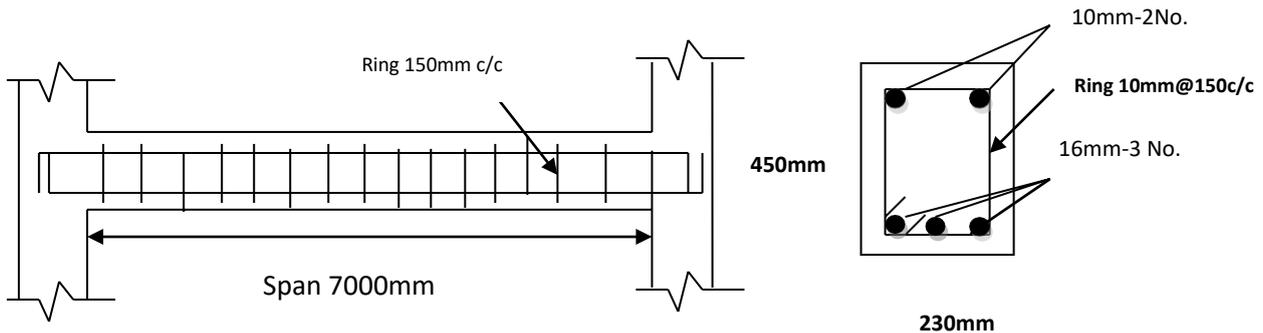

$$\begin{aligned} \text{Number of Main Bar} &= \frac{\text{Length of mesh}}{\text{Spacing of Dist.bar}} + 1 \\ &= \frac{10000}{100} + 1 \\ &= \frac{10000}{100} + 1 \\ &= 100 + 1 = \mathbf{101 \text{ Nos.}} \end{aligned}$$

Note – In this Calculation We learn only how to find cut length of main or dist. bar in mesh and How to find number of main bar or dist. bar without Clear Cover

Procedure to find out cut length of “2L” Rectangular Stirrups

Suppose we have a beam having a Width **230 mm** and having a Depth **450 mm**. The diameter of the stirrup bar is **10 mm**. The clear cover in the beam is **35 mm**.

1. So calculate the cutting length of the rectangular stirrup is going to use the beam?

GIVEN DATA:

Width of beam = 230 mm.

Depth of beam = 450 mm.

Clear cover = 35 mm.

Hook Length = $10d$

Diameter of the stirrup bar = 10 mm.

Calculate cutting length of stirrup = ?

Procedure to be followed for calculating cutting length of rectangular/square stirrup:

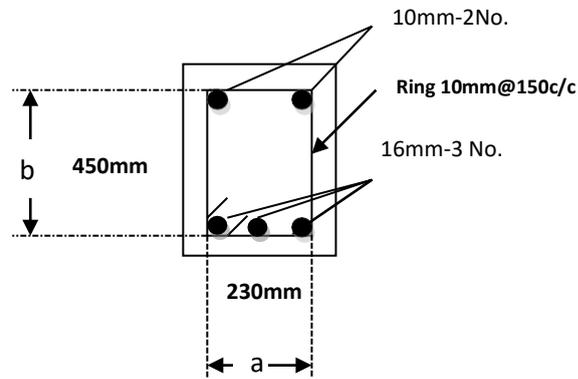

Step 1: Mark c/c distance of stirrup along base as ‘a’ as per the given structural drawing of stirrup.

Step 2: Mark c/c distance of stirrup along depth stirrup as ‘b’ as per the given structural drawing of stirrup.

Step 3: Calculate a & b separately from the given structural drawing of stirrup.

Step 4: See hook Detail in DWG and Count No. of bend for 90degree or 135degree.

Step 5: Now, calculate the cutting length of stirrup.

Length of a = Width – 2(Clear cover) - 2(Half the diameter of the bar)

$$= 230 - 2(35) - 2(5)$$

$$= \mathbf{150 \text{ mm}}$$

Length of b = Depth – 2(Clear cover) – 2(Half the diameter of the bar)

$$= 450 - 2(35) - 2(5)$$

$$= \mathbf{370 \text{ mm}}$$

Cutting length of stirrup.....

Formula = $2(a + b) + 2(10d) - 3(2d) - 2(3d)$

#where

d = Diameter of the stirrup bar.

10d = is the length of the hook

2d = 90° Bends in stirrup(2x10)

3d = 135° Bends from hook sides(3x10)

By putting the given values in the formula we get the length of the stirrup.

$$\text{Length of the bar} = 2(150 + 370) + 2(10 \times 10) - 3(2 \times 10) - 2(3 \times 10)$$

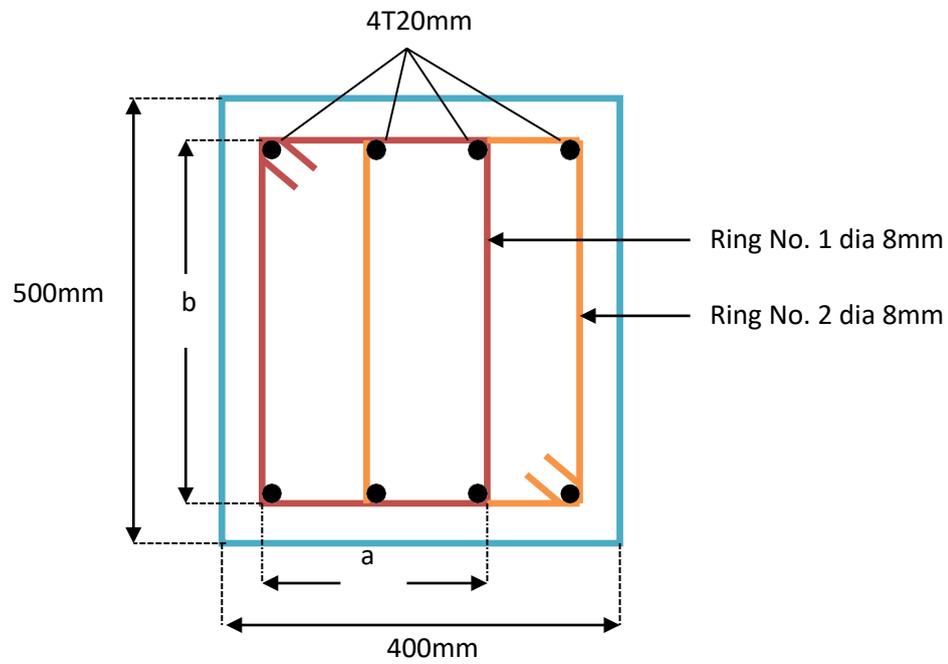

$$= 1040 + 200 - 60 - 60$$

$$= 1040 - 120$$

$$= \mathbf{1120 \text{ mm or } 1.120 \text{ m.}}$$

Procedure to find out cut length of “4L” Rectangular Stirrups

Suppose we have a Beam having a Depth **500 mm** and having a Width **400mm**. The diameter of the stirrup bar is **8 mm**. The clear cover in the Column is **30 mm**

GIVEN DATA:

Width of beam = 400 mm.

Depth of beam = 500 mm.

Clear cover = 30 mm.

Diameter of the stirrup bar = 8 mm.

Calculate cutting length of stirrup 1/2 = ?

Procedure to be followed for calculating cutting length of rectangular/square stirrup:

Step 1: Mark c/c distance of stirrup 1 along width base as 'a' as per the given structural drawing of stirrup.

Step 2: Mark c/c distance of stirrup 1 along depth side as 'b' as per the given structural drawing of stirrup.

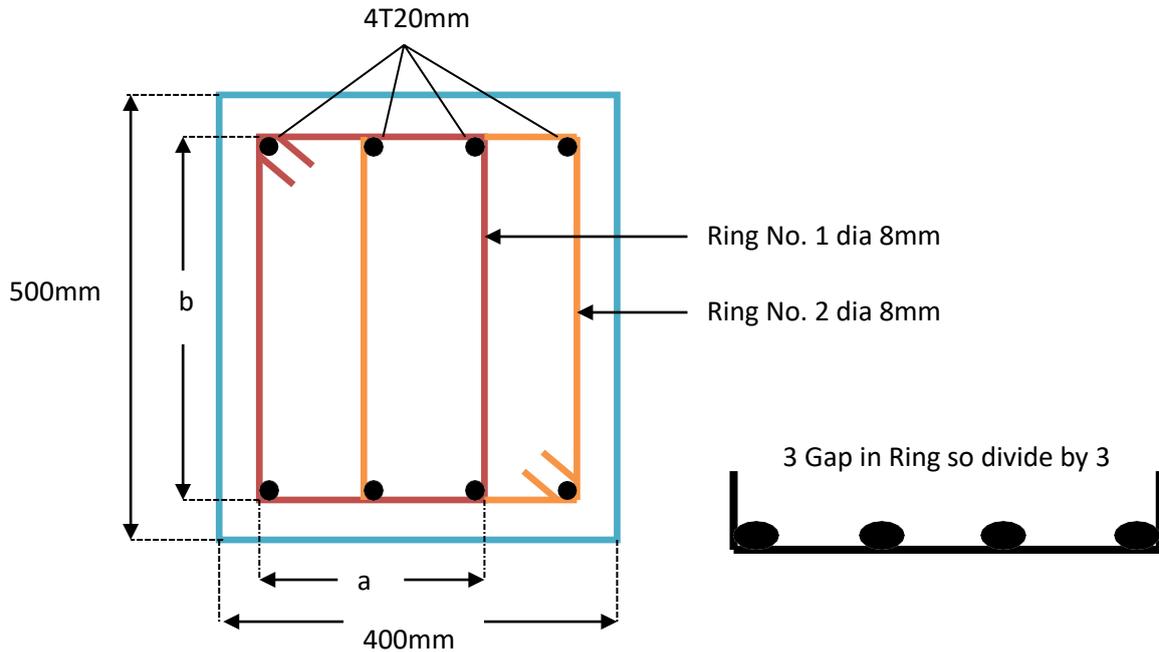

Step 3: Calculate a & b separately from the given structural drawing of stirrup.

Step 4: See hook Detail in DWG and Count No. of bend for 90degree or 135degree.

Step 5: Now, calculate the cutting length of stirrup 1.

Step 6: We know that Cutting Length of Stirrup 2 is same as stirrups 1. Bcoz 4Legged

First Calculate Ring No. 1

$$a = \left\{ \frac{\text{Width} - (2 \times \text{cover}) - (2 \times \text{ring dia}) - (2 \times \text{half of bar})}{3} \right\} \times 2 + \{(2 \times \text{half of bar}) + (2 \times \text{half of ring dia})\}$$

$$= \left\{ \frac{400 - (2 \times 30) - (2 \times 8) - (2 \times 10)}{3} \right\} \times 2 + \{(2 \times 10) + (2 \times 4)\}$$

$$= 230.7 \text{ mm}$$

$$b = \text{Depth} - (2 \times \text{Cover}) - (2 \times \text{half of ring dia})$$

$$= 500 - (2 \times 30) - (2 \times 4)$$

$$= 432 \text{ mm}$$

Cutting Length of Ring 1 = $2(a+b) + \text{hook} - \text{bend deduction}$

$$= 2(a+b) + (2 \times \text{hook length}) - (3 \times 2d \text{ 90deg}) - (2 \times 3d \text{ 135deg})$$

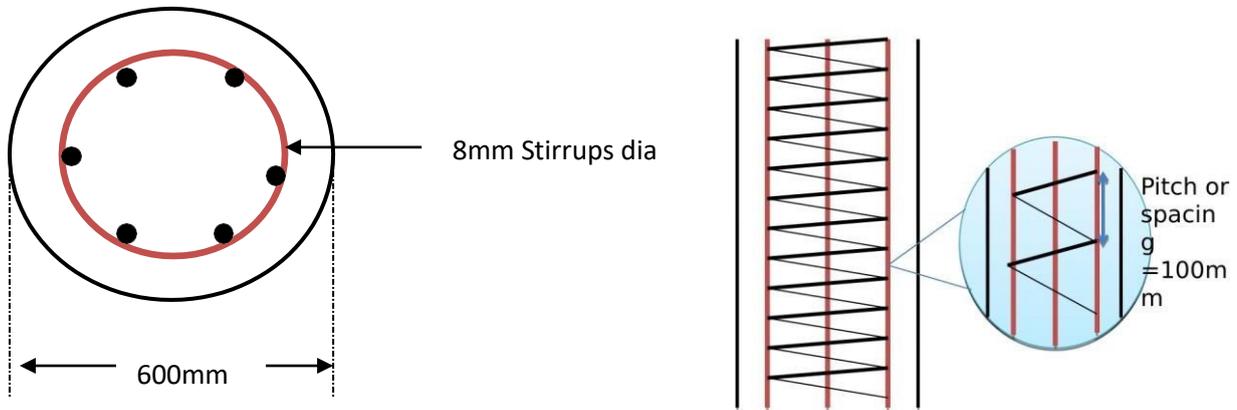

$$= 2(230.7+432) + (2 \times 10 \times 8) - (3 \times 2 \times 8) - (2 \times 3 \times 8)$$

$$= 1389.4 \text{ mm}$$

$$= 1.389 \text{ m}$$

Note - Cutting Length of Ring 2 = same as ring 1 bcoz size of ring is same.

Procedure to find out cut length of Helix (Spiral) Case:-

Given

Diameter of Column	= 600 mm
Height of Column	= 10 m
Clear Cover	= 40 mm
Spacing in Spiral	= 100 mm
Dia. of Spiral Stirrup	= 8mm

Procedure to be followed for calculating cutting length of Helix(spiral) Cage:

Step 1: First of all we Calculate Length of One Spiral.

Step 2: Calculate Number of Spiral According to Height.

Step 3: Calculate the cutting length of Spiral Cage.

Step 1: First of all we Calculate Length of One Spiral.

Length of one Spiral = Circumference of one Spiral = $2 \pi r$

$$= 2 \times 3.14 \times (\text{radius of column} - \text{clear cover})$$

$$= 2 \times 3014 \times (300 - 40)$$

$$= 1632 \text{ mm}$$

$$= 1.632 \text{ m}$$

Step 2: Calculate Number of Spiral According to Height.

$$\text{No of Spiral} = \frac{\text{Length of Column}}{\text{Pitch or Spacing}} + 1$$

$$= \frac{10000}{100} + 1$$

$$= 101$$

Step 3: Calculate the cutting length of Spiral Cage.

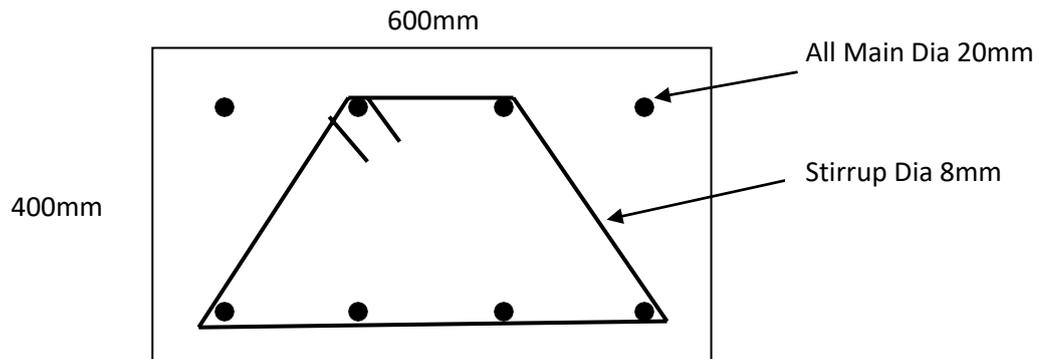

Total Cutting Length Of Spiral Case = No. Of Spiral x Length of one Spiral

Total Cutting Length Of Spiral Case = 101×1.632

$$= 164.832 \text{ m}$$

Procedure to find out cut length of Trapezium Shape Stirrups

If we have col. 400 x 600 mm ..in this Column we found trapezium stirrups ,,
Now, What is the procedure of Calculating This Stirrups.

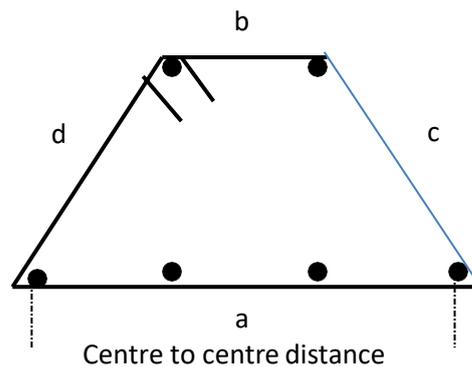

Given

Clear Cover = 25mm

Stirrup Dia = 8mm

Column Main Reinf. = 8 nos 20 mm dia

Dimension of Column = 400 x 600 mm

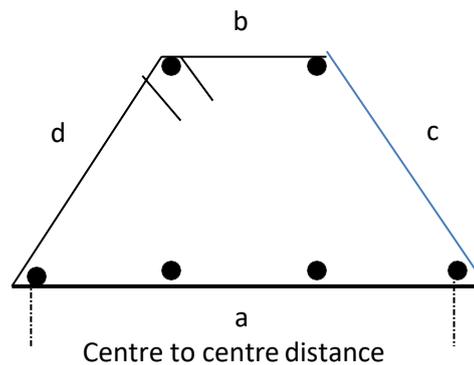

Centre to centre distance of main bar

$$= \{(\text{Length of Column}) - (2 \times \text{Clear Cover}) - (2 \times \text{Stirrups Dia}) - (2 \times \text{Half of Main Vertical Bar Dia})\} /$$

(Number of Equal Division in between Main Vertical Bar)

Centre to centre distance of main bar

$$\begin{aligned} &= \{(\text{Length of Column}) - (2 \times \text{Clear Cover}) - (2 \times \text{Stirrups Dia}) - (2 \times \text{Half of Main Vertical Bar Dia})\} / \\ &\quad (\text{Number of Equal Division in between Main Vertical Bar}) \\ &= \{600 - (2 \times 40) - (2 \times 8) - (2 \times 10)\} / 3 \\ &= (600 - 80 - 16 - 20) / 3 \\ &= 484 / 3 \\ &= \mathbf{161 \text{ mm}} \end{aligned}$$

Calculation of a = (Length of Column) – (2 x Clear Cover)

$$\begin{aligned} &= 600 - (2 \times 40) \\ &= 600 - 80 \\ &= \mathbf{520 \text{ mm}} \end{aligned}$$

Calculation of b = (C/C distance of Main Vertical Bar) + (2 x Half of Main Vertical Bar Dia) + (2 x Stirrups Dia)

$$\begin{aligned} &= \mathbf{161} + (2 \times 10) + (2 \times 8) \\ &= 161 + 20 + 16 \\ &= \mathbf{197 \text{ mm}} \end{aligned}$$

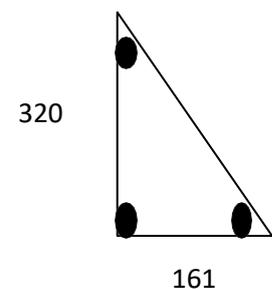

Calculation of c = in this calculation we use pytha goras theorem

HEIGHT = Breadth of Column – (2 x Clear Cover) = 400 – (2 x 40)

$$= 400 - 80 = \mathbf{320 \text{ mm}}$$

BASE = C/C Dist. of Main Bar + (Half of Main Bar Dia) + (Stirrups dia)

$$= 161 + 10 + 8 = \mathbf{179 \text{ mm}}$$

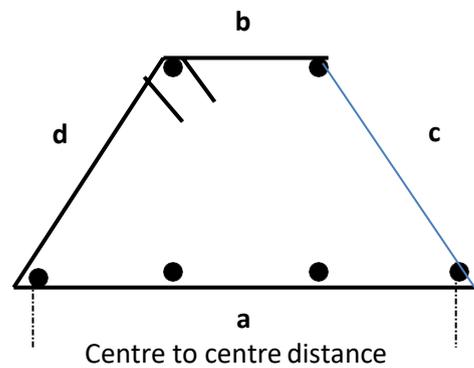

Calculation of c = { (BASE)² + (HEIGHT)²} By Pythagoras Theorem..

$$= \sqrt{\{(179)^2 + (320)^2\}}$$

$$= \sqrt{(32041 + 102400)}$$

$$= \mathbf{367 \text{ mm}}$$

Cutting Length of Trapezium Stirrups = A + B + (2 X C) + Hook – Bend(5 135deg)

$$= 520 + 197 + (2 \times 367) + (2 \times 10 \times 8) - (5 \times 3 \times 8)$$

$$= \mathbf{1491 \text{ mm}}$$

Procedure to find out cut length of Triangular Shape Stirrups

Procedure to be followed for calculating cutting length of Triangular stirrup:

Step 1: Mark c/c distance of stirrup along base as 'a' as per the given structural drawing of stirrup.

Step 2: Mark c/c distance of stirrup along side of triangular stirrup as 'b' as per the given structural drawing of stirrup.

Step 3: Calculate a & b separately from the given structural drawing of stirrup.

Step 4: To calculate H from the given stirrup drawing, draw a perpendicular from apex of triangular stirrup to base of stirrup which is equal to 'b'. (Refer Figure - 2)

Step 5: With the help of Pythagoras theorem, find hypotenuse

Now, calculate the cutting length of stirrup.

Calculation part: **Suppose we take 600x500mm Column.**

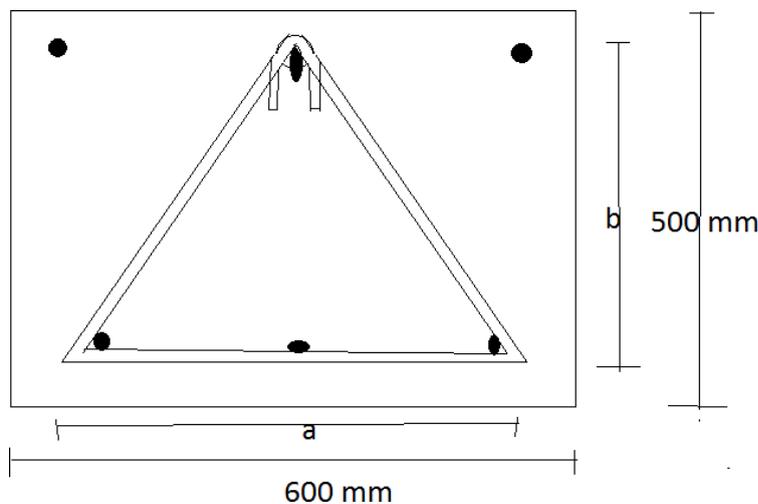

General Notes:

For hook part, consider as 10d.

For 45° bend, consider as d.

For 90° bend, consider as 2d.

For 135° bend, consider as 3d.

Size of column = 600mmx500 mm

Diameter of stirrup bar, $\varnothing = 8\text{mm}$

No. of 135° bend = 4

Take clear cover as 40mm

$a = 600 - 2 \times \text{clear cover} - 2 \times (\text{half of dia of bar})$

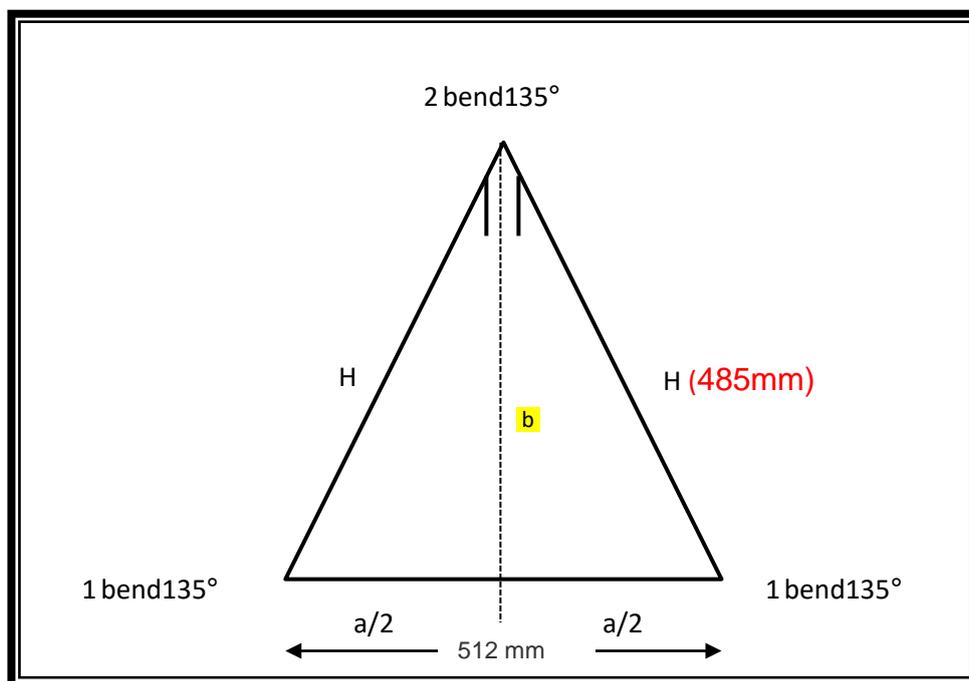

$= 600 - 2 \times 40 - 2 \times (8/2)$

$= 512 \text{ mm.}$

$b = 500 - 2 \times \text{clear cover} - 2 \times (\text{half of dia of bar})$

$= 500 - 2 \times 40 - 2 \times (8/2) = 412 \text{ mm.}$

To calculate H, refer Figure - 2

By using Hypotenuse Formula

- $H = \sqrt{((a/2)^2 + b^2)}$

$$H = \sqrt{((a/2)^2 + b^2)} = \sqrt{((512/2)^2 + (412)^2)}$$

$$H = 485\text{mm.}$$

Now, Cutting length of Traingular stirrup

$= 2 \times H + a + \text{hook} - \text{bend } (135^\circ)$

$= 2 \times H + a + (2 \times 10 \times d) - (4 \text{no.} \times 3 \times d)$

$= 2 \times 485 + 512 + (2 \times 10 \times 8) - (4 \times 3 \times 8)$

$= 1546\text{mm} = 1.546\text{m.}$

Procedure to find out cut length of Diamond Shape Stirrups

Stirrups: Stirrups are lateral ties provided in column to resist shear force and to hold longitudinal bars (main bars) of column in position.

Diamond stirrups are nothing but rhombus shaped stirrup.

Cutting length of Rhombus (Diamond) stirrup:

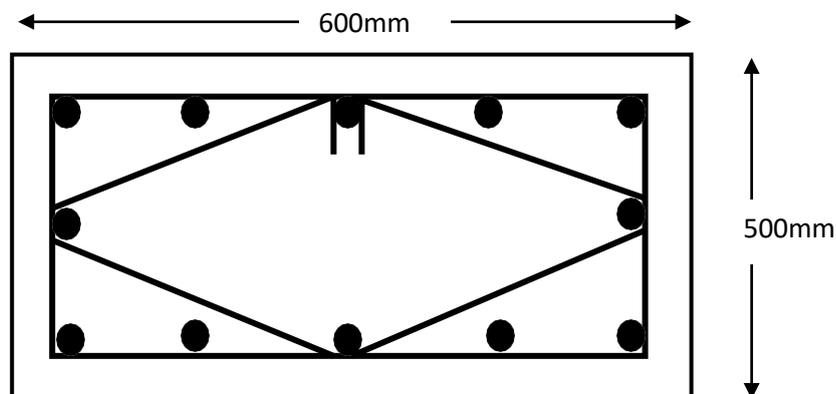

Procedure to be followed for calculating cutting length of Rhombus (Diamond) stirrup:

Step 1: Mark 'a' & 'b' in given structural drawing of stirrup.

Step 2: Calculate any one side of rhombus, H using hypotenuse formula. (refer Figure - 2)

Step 3: Calculate the cutting length of rhombus stirrup.

Calculation part:

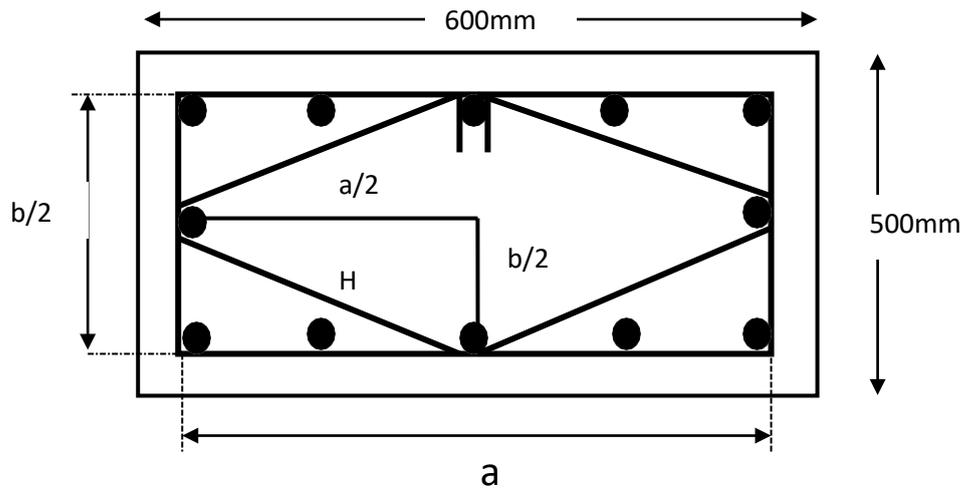

Size of column = 600 x 500mm

Diameter of stirrup bar = 8mm

Stirrups hook = 10 d

Clear cover = 40mm

No. of 90° Bend = 3 & No. of 135° Bend = 2

$$a = 600 - 2 \times \text{clear cover} = 600 - 2 \times 40 = 520\text{mm}$$

$$b = 500 - 2 \times \text{clear cover} = 500 - 2 \times 40 = 420\text{mm}$$

By using Hypotenuse Formula, (**Pythagoras theorem**)

- $H = \sqrt{(a/2)^2 + (b/2)^2}$

$$H = \sqrt{(a/2)^2 + (b/2)^2} = \sqrt{((520/2)^2 + (420/2)^2)}$$

$$H = 334.21 \text{ mm}$$

Now, Cutting length of stirrup

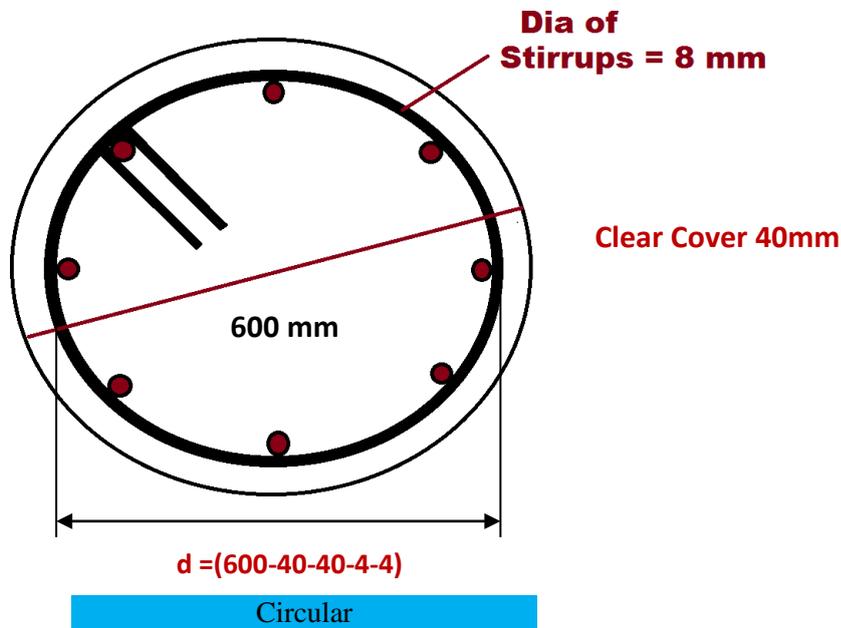

$$= 4 \times H + \{2 \times 10 \times d\} (\text{hook}) - \{3 \times 2 \times d\} (90^\circ \text{ bend}) - \{2 \times 3 \times d\} (135^\circ \text{ bend})$$

$$= 4 \times 334.21 + \{2 \times 10 \times 8\} - \{3 \times 2 \times 8\} - \{2 \times 3 \times 8\}$$

$$= \mathbf{1400.84\text{mm} = 1.4\text{m}}$$

Procedure to find out cut length of Circular Column Stirrups

Example...if we have circular column size 600 mm ...then how to find Cutting Length

Given....

From the Diagram,

Clear Cover = 40mm

Column Diameter (D) = 600 mm

Stirrups = 8mm,, Hook Length = 10d

Mark c/c distance of stirrup (d)

$d = (\text{Total Diameter of column} - \text{both side cover} - \text{both side stirrup half dia.})$

$d = (600 - 40 - 40 - 4 - 4) = 512\text{mm c/c}$

Cutting Length = Circumference of stirrup + (2 × hook length) - (2×90°bend)

= $\pi d + (2 \times 10 \times 8) - (2 \times 2 \times 8)$

= $3.14 \times 512 + (160) - (32)$

= $1608 - 160 - 32$

= **1736 mm = 1.736 Mtr.**

Procedure to find out cut length of Bent up Bar

As a site engineer, you need to calculate the cutting length of bars according to the slab dimensions and give instructions to the bar benders.

For small area of construction, you can hand over the reinforcement detailing to the bar benders. They will take care of cutting length. But beware, that must not be accurate. Because they do not give importance to the bends and cranks. They may give some extra inches to the bars for the bends which are totally wrong. So it is always recommended that as a site engineer calculate the cutting length yourself.

Where,

Diameter of the bar = 12 mm

Clear Cover = 25 mm

Clear Span (L) = 8000

Slab Thickness = 200 mm

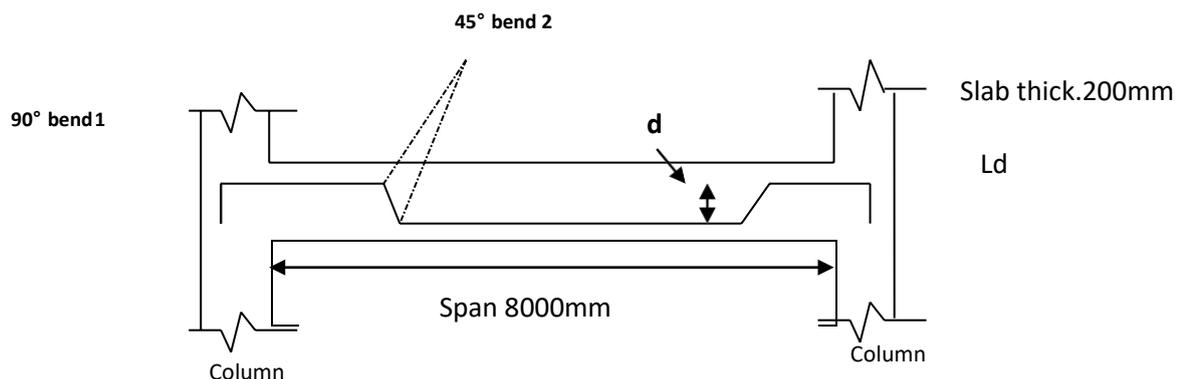

Development Length (Ld) = 40d

Cutting Length = Clear Span of Slab + (2 x Development Length) +
(2 x inclined length) – (45° bend x 4) – (90° bend x 2)

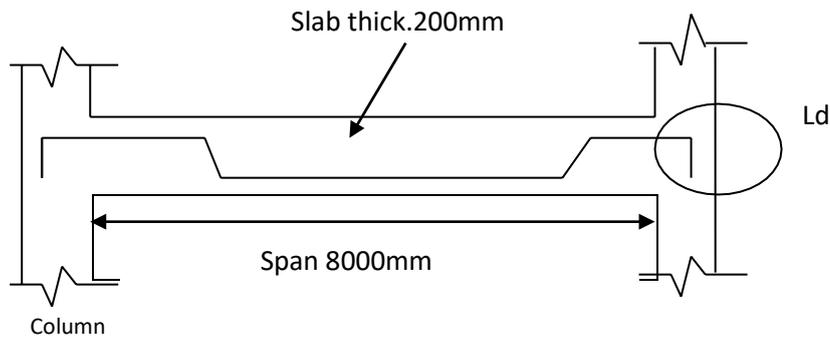

Inclined length = 0.42 D

As you can see there are four 45° bends at the inner side (1,2,3 & 4) and two 90° bends (a,b).

45° = 1d ; 90° = 2d

Cutting Length = Clear Span of Slab + (2 X Ld) + (2 x 0.42D) – (1d x 4) - (2d x 2)

Cutting Length = Clear Span of Slab + (2 X Ld) +(2 x 0.42D) – (1d x 4) – (2d x 2)
 [BBS Shape Codes]

Where,

d = Diameter of the bar.

Ld = Development length of bar.

D = Height of the bend bar.

In the above formula, all values are known except ‘D’.

So we need to find out the value of “D”.

D = Slab Thickness – (2 x clear cover) – (diameter of bar)

$$= 200 - (2 \times 25) - 12$$

$$= 138 \text{ mm}$$

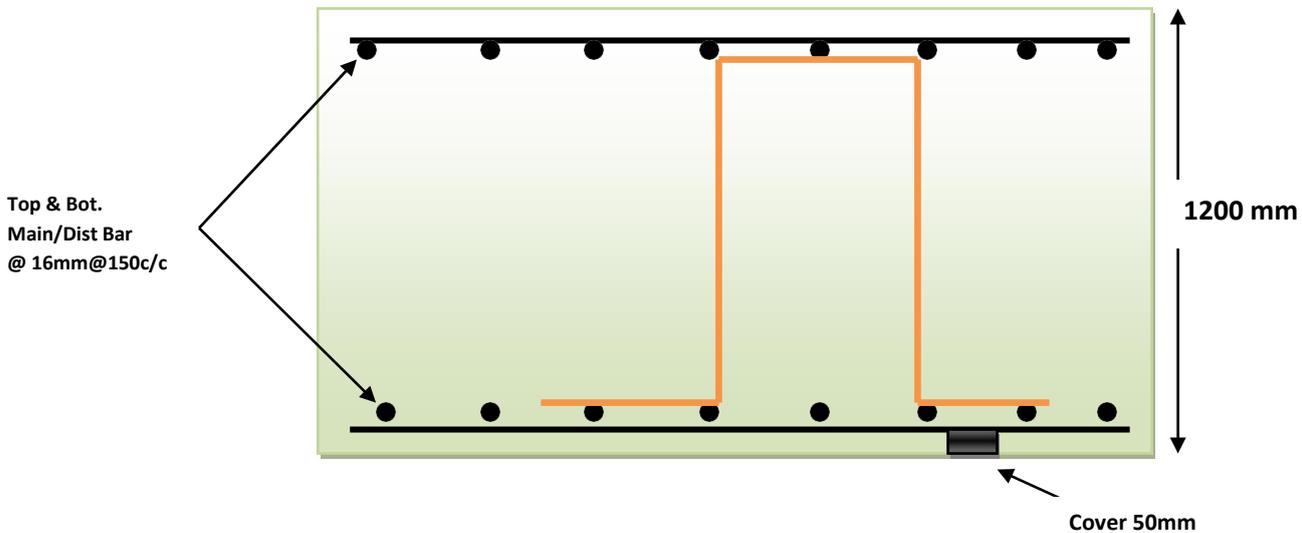

Now, putting all values in the formula

Cutting Length = Clear Span of Slab + (2 x Ld) +(2 x 0.42D) – (1d x 4) – (2d x 2)

$$= 8000 + (2 \times 40 \times 12) +(2 \times 0.42 \times 138) - (1 \times 12 \times 4) - (2 \times 12 \times 2)$$

Cutting Length = 8980 mm or 8.98 m.

How to calculate Cutting length of Chair Bar in Raft Footing .

Given :-

Raft Footing

Height of footing = 1.2 m

Main bars & dist. Bar = 16 mm dia @ 150 mm c/c Top or Bottom.

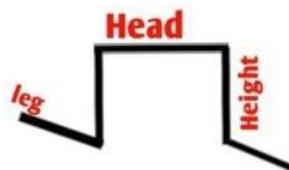

Clear Cover = 50 mm

Cutting length of chair bar = ?

Step 1 : Find out the height of chair bar.

Chair Height = Footing Height - [(Upper + Lower Side Cover) + (Upper side main & dist. bar dia + lower side main bar dia)]

Chair Height = 1200 mm - [(50+50) + (16+16+16)] mm = **1052 mm** or 1.052 m

Step 2 : Head of chair bar = 50 x d (dia= 12 mm)

So, 50 x 12 = **600** (the diameter of bar should not be under 12 mm)

Step 3 : Chair bar leg = 2 nos c/c distance + 50 mm (bars which are located at bottom)

= 2 x 150 mm + 50 mm = **350** mm

Cutting length of chair = (1head + 2 height + 2 leg) _4 bend of 90°

Now, the cutting length will be calculated as follow

= [600 + (1052 x 2) + (350 x 2)] - (4 x 2 x 12) mm (as the chair is bent at 4 sides..4x2d)

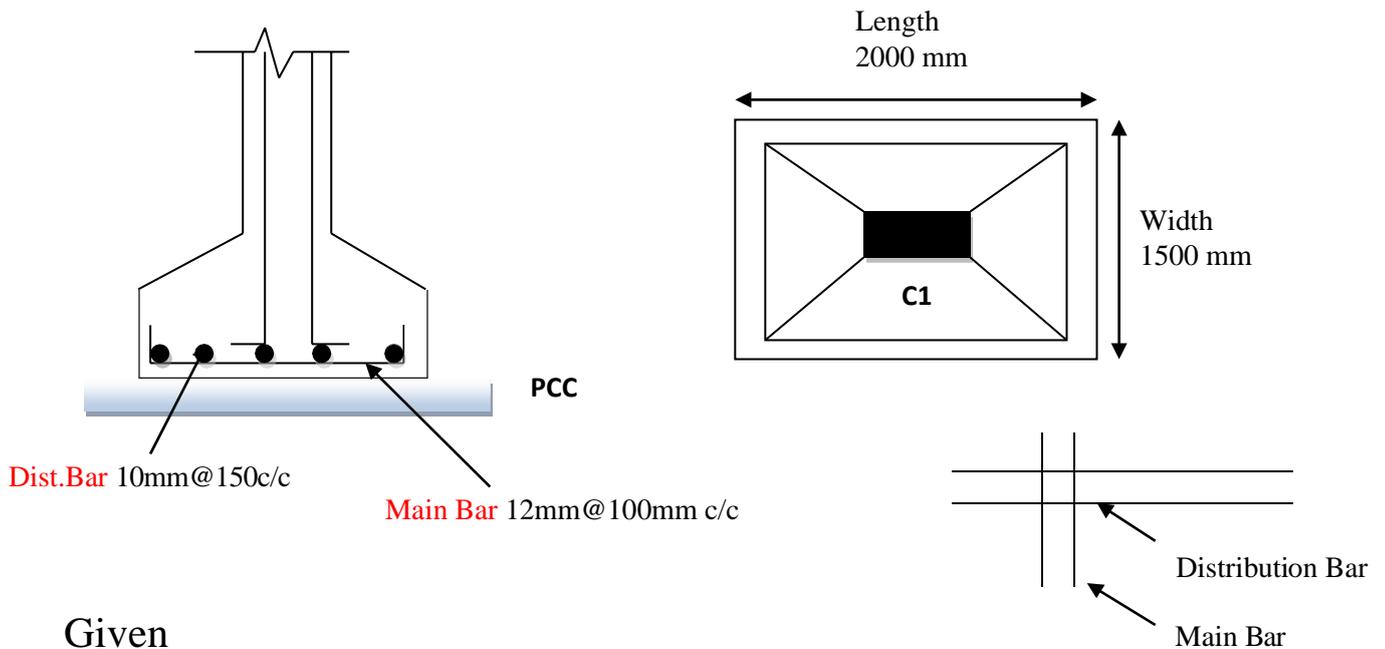

= **3308 mm or 3.308 mtr**

Bar Bending Schedule

Part - C

3.1 Bar Bending Schedule for Isolated footing

If we have isolated Footing then how to Calculate Reinforcement for BBS.

Given

Size of Footing	= 2000mm x 1500mm
Clear Cover	= 50 mm
No. Of Footing	= 1 nos
Main Bar	= 12mm @ 100 mm c/c Spacing
Distribution Bar	= 10mm @ 150 mm c/c Spacing
Hook Length	= 9d

Step : 1 Cutting Length of Main Bar

The Main Bar is Always in the Short Span ,wheather it is a Slab or Footing.

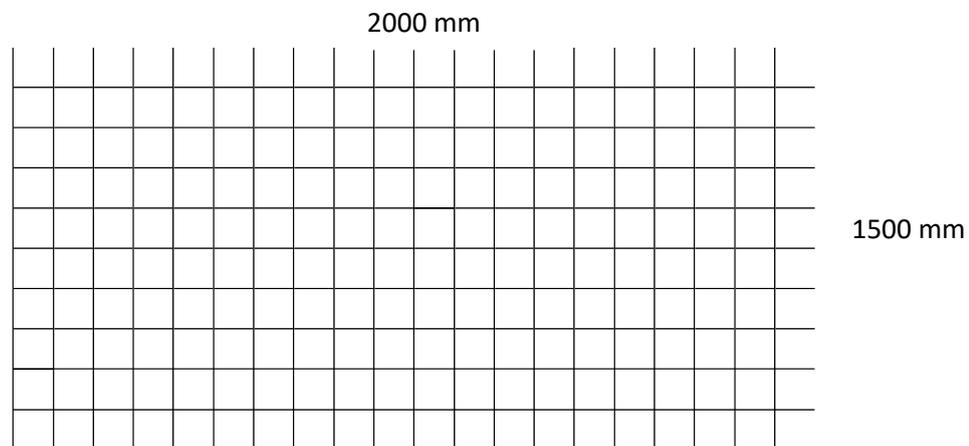

$$\begin{aligned}
 \text{Cutting Length of Main Bar} &= \text{Width of Footing} - (2 \times \text{Clear Cover}) + (2 \times 9d \text{ hook}) - \\
 &\quad (2 \text{ bend } 90\text{deg}) \\
 &= 1500 \text{ mm} - (2 \times 50) + (2 \times 9 \times 12) - (2 \times 2 \times 12) \\
 &= 1500 \text{ mm} - 100 + 216 - 48 \\
 &= \mathbf{1568 \text{ mm}}
 \end{aligned}$$

Step : 2 Cutting Length of Distribution Bar

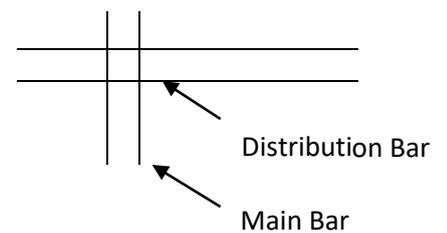

$$\begin{aligned}
 \text{Cutting Length of Distribution Bar} &= \text{Length of Footing} - (2 \times \text{Clear Cover}) + (2 \times 9d \text{ hook}) - \\
 &\quad (2 \text{ bend } 90\text{deg}) \\
 &= 2000 \text{ mm} - (2 \times 50) + (2 \times 9 \times 10) - (2 \times 2 \times 10) \\
 &= 2000 \text{ mm} - 100 + 180 - 40 \\
 &= \mathbf{2040 \text{ mm}}
 \end{aligned}$$

Step : 3 Number of Main Bar(12 mm) in Footing.

$$\begin{aligned}
 \text{Number of Main Bar} &= \frac{\text{Length} - (2 \times \text{Clear Cover})}{\text{Spacing}} + 1 \\
 &= \frac{2000 - (2 \times 50)}{100} + 1 \\
 &= \frac{1900}{100} + 1 \\
 &= \mathbf{20 \text{ Nos.}}
 \end{aligned}$$

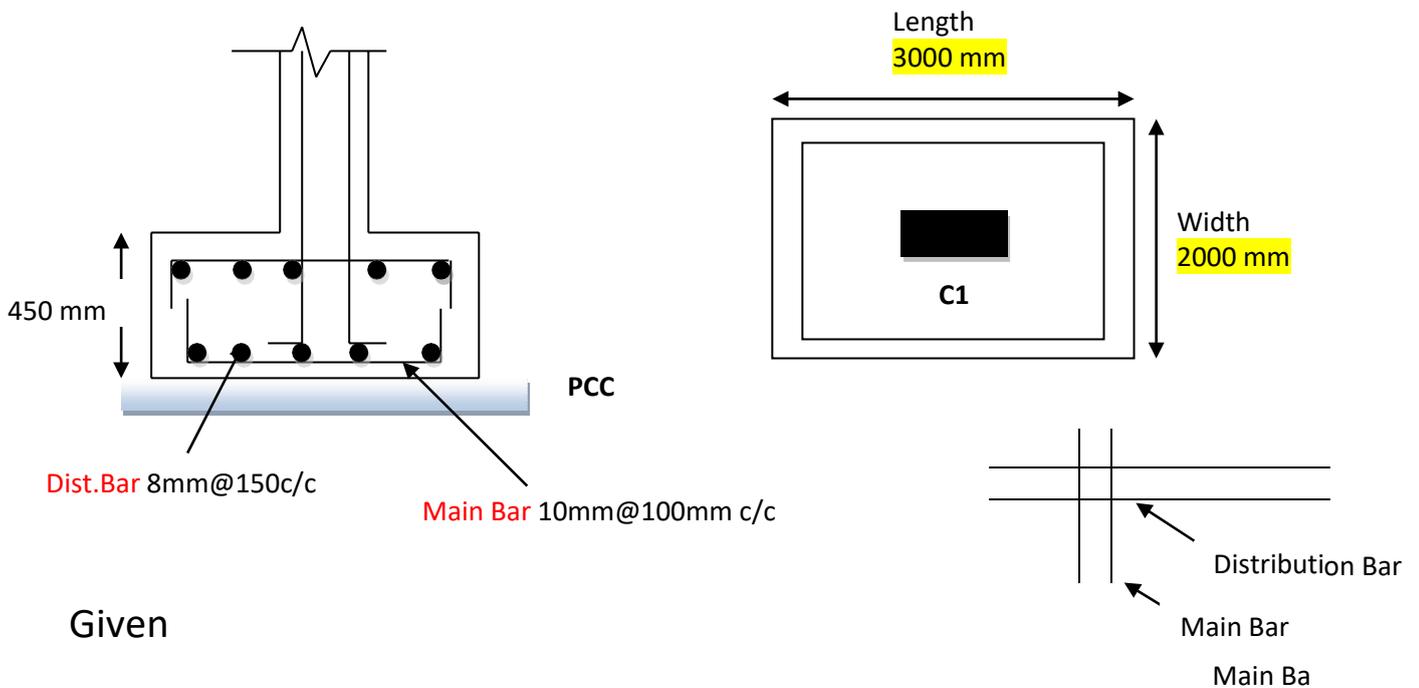

Step : 4 Number of Distribution Bar(10 mm) in Footing.

$$\begin{aligned}\text{No. of Distribution Bar} &= \frac{\text{Width} - (2 \times \text{Clear Cover})}{\text{Spacing}} + 1 \\ &= \frac{1500 - (2 \times 50)}{150} + 1 \\ &= \frac{1400}{150} + 1 \\ &= 10.33 \text{ (we say 10 bar)}\end{aligned}$$

3.2 Bar Bending Schedule for Raft footing

If we have Raft Rectangular Footing then how to Calculate Reinforcement for BBS.

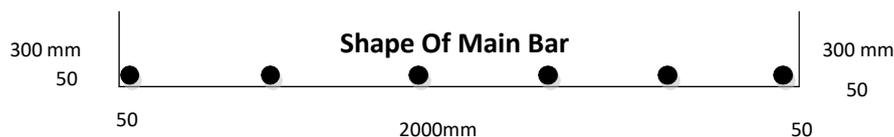

Given

Size of Footing(CF2) = 3000mm x 2000mm
 Height = 450mm
 Clear Cover = 50 mm
 No. Of Footing = 2 nos

Main Bar Top or Bottom = 10mm @ 100 mm c/c Spacing
 Distribution Bar Top or Bottom = 8mm @ 150 mm c/c Spacing

Step : 1 Cutting Length of Main Bar Bottom or Top

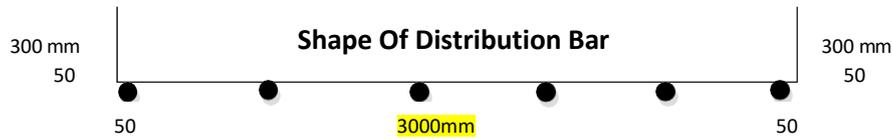

The Main Bar is Always in the Short Span ,wheather it is a Slab or Footing.

$$\begin{aligned}
 \text{Cutting Length of Main Bar} &= \text{Width of Footing} - (2 \times \text{Cover}) + (2 \times \text{Height}) - (2 \text{ bend}90\text{deg}) \\
 &= 2000 \text{ mm} - (2 \times 50) + (2 \times 300) - (2 \times 2 \times 10) \\
 &= 2000 \text{ mm} - 100 + 600 - 40 \\
 &= 2460 \text{ mm}
 \end{aligned}$$

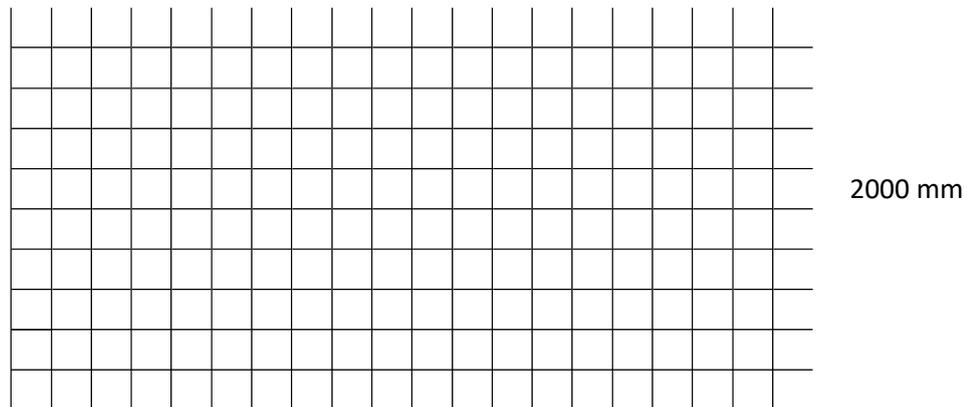

Step : 2 Cutting Length of Distribution Bar Bottom or Top

The Main Bar is Always in the Short Span ,wheather it is a Slab or Footing.

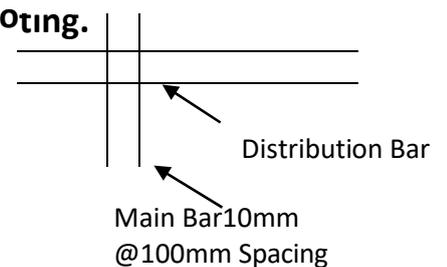

$$\begin{aligned}
 \text{Cutting Length of Dist. Bar} &= \text{length of Footing} - (2 \times \text{Cover}) + (2 \times \text{Height}) - (2 \text{ bend } 90^\circ) \\
 &= 3000 \text{ mm} - (2 \times 50) + (2 \times 300) - (2 \times 2 \times 8) \\
 &= 3000 \text{ mm} - 100 + 600 - 32 \\
 &= \mathbf{3468 \text{ mm}}
 \end{aligned}$$

3000 mm

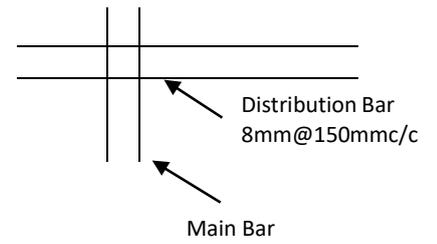

Step : 3 Number of Top or Bottom Main Bar(10 mm) in Footing.

$$\begin{aligned}
 \text{Number of Main Bar} &= \frac{\text{Length} - (2 \times \text{Clear Cover})}{\text{Spacing}} + 1 \\
 &= \frac{3000 - (2 \times 50)}{100} + 1 \\
 &= \frac{2900}{100} + 1 \\
 &= 30 \text{ Nos. X 2 (top or bottom)} \\
 &= \mathbf{60 \text{ Nos.}}
 \end{aligned}$$

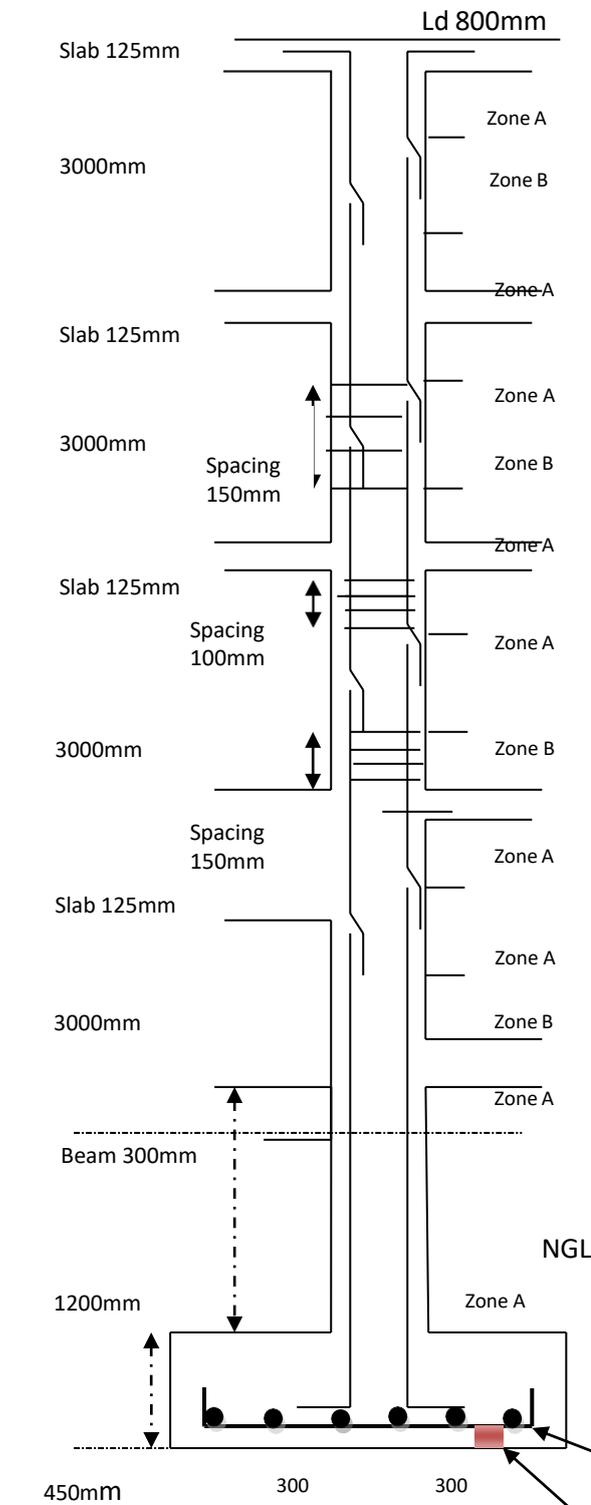

Step : 4 Number of Top or Bottom Distribution Bar(10 mm) in Footing.

$$\begin{aligned} \text{Number of Main Bar} &= \frac{\text{width} - (2 \times \text{Clear Cover})}{\text{Spacing}} + 1 \\ &= \frac{2000 - (2 \times 50)}{150} + 1 \\ &= \frac{1900}{150} + 1 \\ &= 13.66 \text{ Nos}\{14 \text{ bar}\}. \times 2(\text{top or bottom}) \\ &= 28 \text{ Nos.} \end{aligned}$$

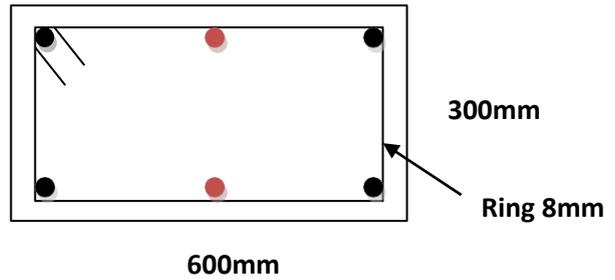

3.3 Bar Bending Schedule For Column(G+3)

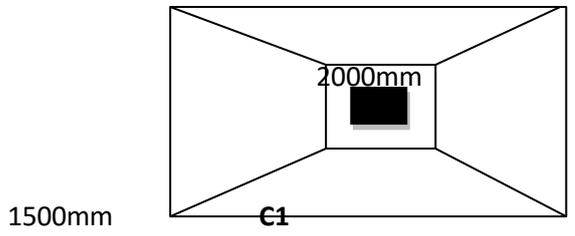

Given

C 1 Column Size 600 x 300mm

- 20mm 4 nos
- 16mm 2 nos

Clear Cover in Column	40mm
Clear Cover in slab	25mm
Clear Cover in footing	50mm
Overlap Length	50d
Column L	300mm
Development Length Ld	50 d
Hook	9d
Ring Spacing at Zone A L/4	100mm
at Zone B L/2	150mm
Slab Thickness	125mm
Plinth Beam Depth	300mm
Floor to Floor Internally	3000mm
No. Of Column	5

Footing Mesh Reinforcement
 Main Bar 20mm
 Distribution Bar 20mm
 Footing Cover 50mm

Step 1 – Find the Cutting length of Vertical Bar(20mm)

$$\text{Cutting Length of Vertical bar 20 mm} = (\text{Length of bar Below Plinth Beam}) + (\text{Plinth Beam}) + (\text{Full Length of Bar Above Plinth beam})$$

First we Calculate Full Length Of Bar below Plinth Level

Length of bar Below Plinth Beam

$$= (\text{Column L}) + (\text{Footing Height} - \text{Clear Cover} - \text{Main bar} - \text{Dist.Bar}) + (\text{Column Height below Plinth})$$

$$= 300 + (450 - 50 - 20 - 20) + 1200 \text{ mm}$$

$$= 300 + 360 + 1200 \text{ mm}$$

$$= 1860 \text{ mm} = 1.860 \text{ Meter}$$

Second we Calculate Full Length Of Bar Above Plinth Level.

$$= (\text{G.F} + 1^{\text{st}} + 2^{\text{nd}} + 3^{\text{rd}} \text{ Floor Height Internally}) + (\text{Slab Thickness G.F} + 1^{\text{st}} + 2^{\text{nd}}) + (4^{\text{th}} \text{ Slab Ld})$$

$$= (4 \times 3000) + (3 \times 125) + (50 \times 20)$$

$$= 12000 \text{ mm} + 375 \text{ mm} + 1000 \text{ mm}$$

$$= 13375 \text{ mm} = 13.375 \text{ Meter}$$

$$\text{Cutting Length of Vertical bar 20 mm} = (\text{Length of bar Below Plinth Beam}) + (\text{Plinth Beam}) + (\text{Full Length of Bar Above Plinth beam})$$

$$= 1860 \text{ mm} + 300 \text{ mm} + 13375 \text{ mm}$$

$$= 15535 \text{ mm} = 15.535 \text{ Meter}$$

15.335m > 12m i.e. provide **Overlap According to Practically Requirement**...if we will provide 1 lap only then..problem face in handling of vertical bar,so Overlap Provide Floor to Floor For Easily Handling and Perfection in Alignment of bar..

$$= 15535 + (4 \times 50 \times d)$$

$$= 15535 + (4 \times 50 \times 20)$$

$$= 15535 + 4000$$

Cutting Length of Vertical bar 20 mm = 19535 mm or 19.535 Meter

- OverLap Note Point –
1. Splice Located minimum but away from column & Beam Junction.this portion left Atleast L/4 portion ,
 2. Laps should be staggered and alternate.
 - 3.Laps should not be parallel to each other.

Step 2 – Find the Cutting length of Vertical Bar(16mm)

First we Calculate Full Length Of Bar below Plinth Level

Length of bar Below Plinth Beam

$$\begin{aligned}
 &= (\text{Column L}) + (\text{Footing Height} - \text{Clear Cover} - \text{Main bar} - \text{Dist.Bar}) + (\text{Column Height below Plinth}) \\
 &= 300 + (450 - 50 - 20 - 20) + 1200 \text{ mm} \\
 &= 300 + 360 + 1200 \text{ mm} \\
 &= 1860 \text{ mm} = 1.860 \text{ Meter}
 \end{aligned}$$

Second we Calculate Full Length Of Bar Above Plinth Level.

$$\begin{aligned}
 &= (\text{G.F} + 1^{\text{st}} + 2^{\text{nd}} + 3^{\text{rd}} \text{ Floor Height Internally}) + (\text{Slab Thickness G.F} + 1^{\text{st}} + 2^{\text{nd}}) + (4^{\text{TH}} \text{ Slab Ld}) \\
 &= (4 \times 3000) + (3 \times 125) + (50 \times 16) \\
 &= 12000 \text{ mm} + 375 \text{ mm} + 800 \text{ mm} \\
 &= 13175 \text{ mm} = 13.175 \text{ Meter.}
 \end{aligned}$$

$$\begin{aligned}
 \text{Cutting Length of Vertical bar 16 mm} &= (\text{Length of bar Below Plinth Beam}) + (\text{Plinth Beam}) \\
 &\quad + (\text{Full Length of Bar Above Plinth beam})
 \end{aligned}$$

$$\begin{aligned}
 &= 1860 \text{ mm} + 300 \text{ mm} + 13175 \text{ mm} \\
 &= 15335 \text{ mm} = 15.335 \text{ Meter}
 \end{aligned}$$

15.335m > 12m i.e. provide **Overlap According to Practically Requirement**...if we will provide 1 lap only then..problem face in handling of vertical bar,so Overlap Provide Floor to Floor For Easily Handling and Perfection in Alignment of bar..

$$\begin{aligned}
 &= 15335 + (4 \times 50 \times d) \\
 &= 15335 + (4 \times 50 \times 16) \\
 &= 15335 + 3200
 \end{aligned}$$

$$\text{Cutting Length of Vertical bar 16 mm} = 18535 \text{ mm or } 18.535 \text{ Meter}$$

Cutting length of 20mm/16mm Vertical Bar

Cutting Length of Vertical bar 20 mm	19535 mm or 19.535 Meter
Cutting Length of Vertical bar 16 mm	18535 mm or 18.535 Meter (diff in overlap)

Step 3 – Cutting Length of Stirrups

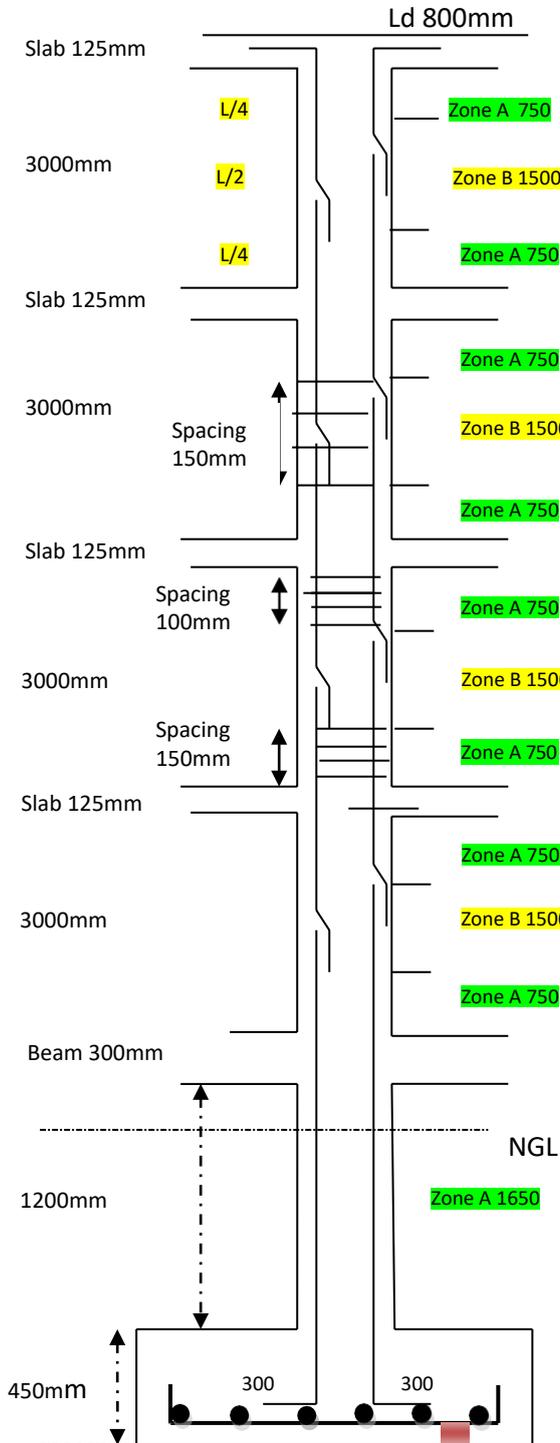

Length of One Hook = 9d

Calculation of A = 600 - 40 - 40 - 4 - 4 = 512 mm

Calculation of B = 300 - 40 - 40 - 4 - 4 = 212 mm

$$\begin{aligned}
 \text{Cutting length of Stirrup} &= \text{Perimeter of stirrup} + \text{No. Of Hook} - \text{Bend Deduction } 90/135 \text{ deg} \\
 &= 2(A+B) + (2 \times 9d \text{ Hook}) - (3 \times 2d \text{ } 90 \text{ Deg Bend}) - (2 \times 3d \text{ } 135 \text{ Deg Bend}) \\
 &= 2(512+212) + (2 \times 9 \times 8) - (3 \times 2 \times 8) - (2 \times 3 \times 8) \\
 &= 1496 \text{ mm}
 \end{aligned}$$

Step 4 – Number of Stirrups in Zone A or Zone B

1st Number of Ring in Zone A ????

Number of Ring = (Distance/Spacing)+1

Zone A Total Length
= 1650 + (8 x 750) + (3x125 Slab)+(300 beam)

Zone A Spacing(given) = 100mm c/c

Number of Ring in Zone A=(Distance/Spacing)+1
= (8325/100)+1
= 83.25 +1 = **84 Rings**

2nd Number of Ring in Zone B ????

Number of Ring = (Distance/Spacing)+1

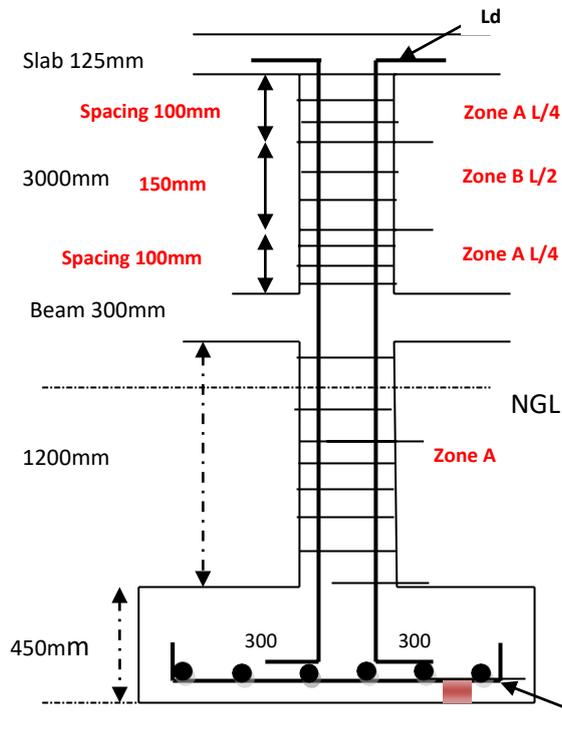

Zone A Total Length
= 1500 X 4
= 6000 mm

Zone B Spacing(given) = 150mm c/c

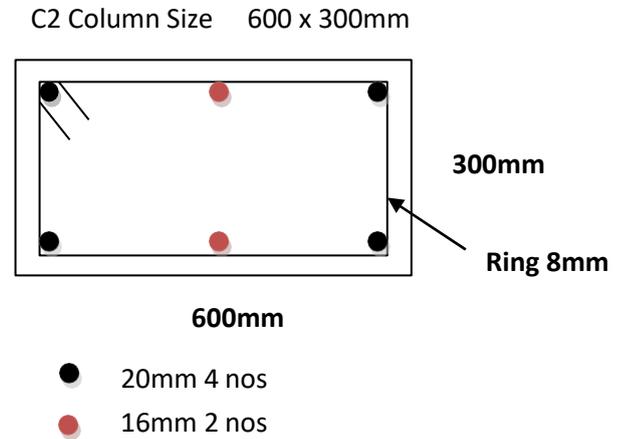

Number of Ring in Zone B=(Distance/Spacing)+1
= (6000/150)+1
= 40 +1 = **41 Rings**

Number of Ring in Zone A	= 84 Rings
Number of Ring in Zone B	= 41 Rings
Total Number of Ring in Zone A/Zone B	= 125 Rings

Bar Bending Schedule For Column Without Overlap

Given

Footing Mesh Reinforcement
Main Bar 20mm
Distribution Bar 20mm

Clear Cover in Column	40mm
Clear Cover in slab	25mm
Clear Cover in footing	50mm
Column L	300mm
Development Length Ld	50 d
Hook	9d
Ring Spacing at Zone A L/4	100mm
at Zone B L/2	150mm
Slab Thickness	125mm
Plinth Beam Depth	300mm
Floor to Floor Internally	3000mm
Number of Column	10

Step 1 – Find the Cutting length of Vertical Bar(20mm)

$$\text{Cutting Length of Vertical bar 20 mm} = (\text{Length of bar Below Plinth Beam}) + (\text{Plinth Beam}) \\ + (\text{Full Length of Bar Above Plinth beam})$$

First we Calculate Full Length Of Bar below Plinth Level

Length of bar Below Plinth Beam

$$= (\text{Column L}) + (\text{Footing Height} - \text{Clear Cover} - \text{Main bar} - \text{Dist.Bar}) + (\text{Column Height below Plinth})$$

$$= 300 + (450 - 50 - 20 - 20) + 1200 \text{ mm}$$

$$= 300 + 360 + 1200 \text{ mm}$$

$$= 1860 \text{ mm} = 1.860 \text{ Meter}$$

Second we Calculate Full Length Of Bar Above Plinth Level.

$$= (\text{G.F Height} + \text{Slab Ld})$$

$$= \{3000 + (50 \times 20)\}$$

$$= 3000 \text{ mm} + 1000 \text{ mm}$$

$$= 4000 \text{ mm} = 4 \text{ Meter}$$

$$\text{Cutting Length of Vertical bar 20 mm} = (\text{Length of bar Below Plinth Beam}) + (\text{Plinth Beam}) \\ + (\text{Full Length of Bar Above Plinth beam}) \\ = 1860 \text{ mm} + 300 \text{ mm} + 4000 \text{ mm}$$

$$= 6160 \text{ mm} = 6.160 \text{ Meter}$$

6.610 m < 12m i.e.....its Mean **NO NEED TO OVERLAP**

Step 2 – Find the Cutting length of Vertical Bar(16mm)

First we Calculate Full Length Of Bar below Plinth Level

Length of bar Below Plinth Beam

$$= (\text{Column L}) + (\text{Footing Height} - \text{Clear Cover} - \text{Main bar} - \text{Dist.Bar}) + (\text{Column Height below Plinth})$$

$$= 300 + (450 - 50 - 20 - 20) + 1200 \text{ mm}$$

$$= 300 + 360 + 1200 \text{ mm}$$

$$= 1860 \text{ mm} = 1.860 \text{ Meter}$$

Second we Calculate Full Length Of Bar Above Plinth Level.

$$= (\text{G.F Height} + \text{Slab Ld})$$

$$= \{3000 + (50 \times 16)\}$$

$$= 3000 \text{ mm} + 800 \text{ mm}$$

$$= 3800 \text{ mm} = 3.8 \text{ Meter}$$

$$\text{Cutting Length of Vertical bar 16 mm} = (\text{Length of bar Below Plinth Beam}) + (\text{Plinth Beam}) \\ + (\text{Full Length of Bar Above Plinth beam})$$

$$= 1860 \text{ mm} + 300 \text{ mm} + 3800 \text{ mm}$$

$$= 5960 \text{ mm} = 5.96 \text{ Meter}$$

Cutting length of 20mm/16mm Vertical Bar

Cutting Length of Vertical bar 20 mm	6160 mm or 6.160 Meter
Cutting Length of Vertical bar 16 mm	5960 mm or 5.960 Meter

Step 3 – Cutting Length of Stirrups

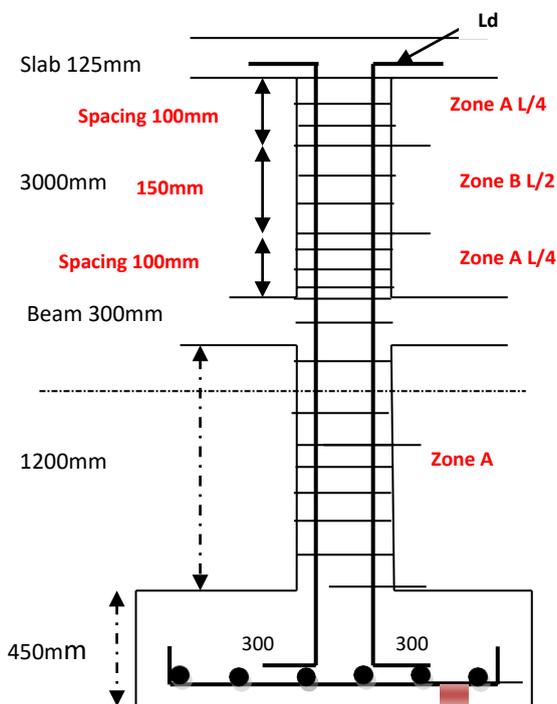

Length of One Hook = **9d**

Calculation of A = $600 - 40 - 40 - 4 - 4 = 512 \text{ mm}$

Calculation of B = $300 - 40 - 40 - 4 - 4 = 212 \text{ mm}$

Cutting length of Stirrup = Perimeter of stirrup + No. Of Hook – Bend Deduction 90/135deg
 $= 2(A+B) + (2 \times 9d \text{ Hook}) - (3 \times 2d \text{ 90Deg Bend}) - (2 \times 3d \text{ 135 Deg Bend})$
 $= 2(512+212) + (2 \times 9 \times 8) - (3 \times 2 \times 8) - (2 \times 3 \times 8)$
 $= 1496 \text{ mm}$

Step 4 – Number of Stirrups in Zone A or Zone B

Number of Ring in Zone A	= 36 Rings
Number of Ring in Zone B	= 11 Rings
Total Number of Ring in Zone A/Zone B	= 46 Rings

1st Number of Ring in Zone A ????

Number of Ring = $(\text{Distance}/\text{Spacing}) + 1$

Zone A Total Length
 $= 1650 + (2 \times 750 \text{ L/4}) + (300 \text{ beam})$
 $= 3450 \text{ mm}$

Zone A Spacing(given) = 100mm c/c

Number of Ring in Zone A = $(\text{Distance}/\text{Spacing}) + 1$
 $= (3450/100) + 1$
 $= 34.5 + 1 = 36 \text{ Rings}$

2nd Number of Ring in Zone B ????

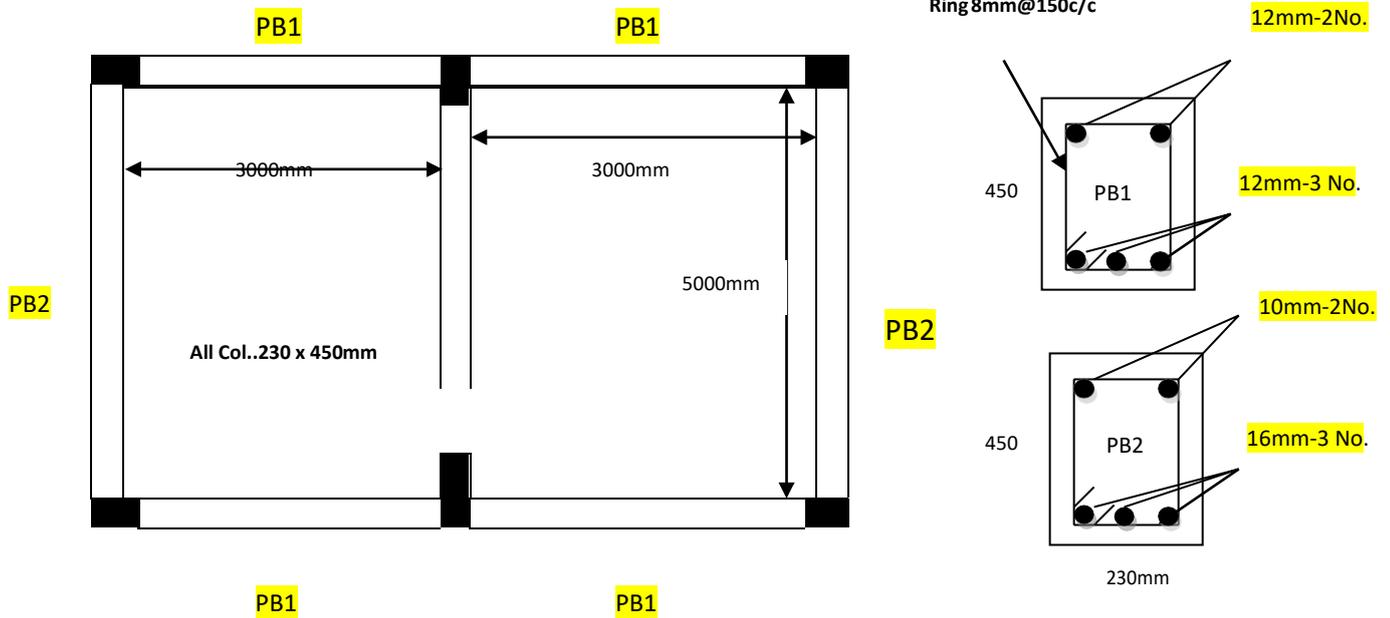

Number of Ring = $(\text{Distance}/\text{Spacing}) + 1$

Zone A Total Length
 $= 1500 \text{ mm}$

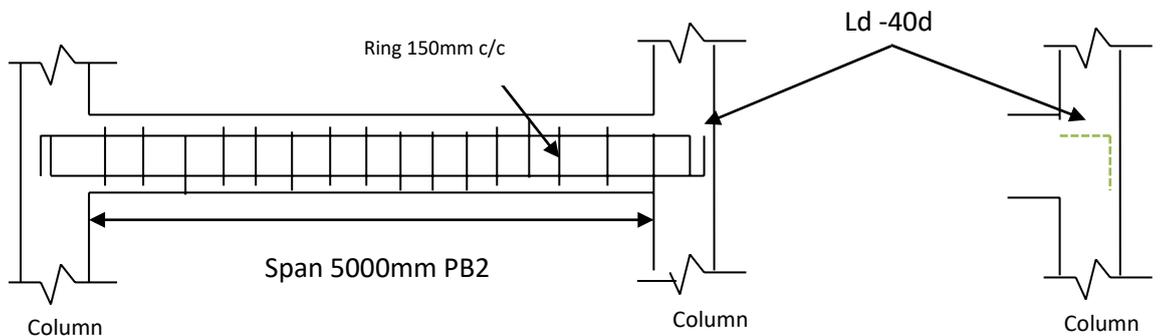

Zone B Spacing(given) = 150mm c/c

Number of Ring in Zone B = $(\text{Distance}/\text{Spacing}) + 1$
 $= (1500/150) + 1$
 $= 10 + 1 = 11 \text{ Rings}$

Bar Bending Schedule For Plinth Beam

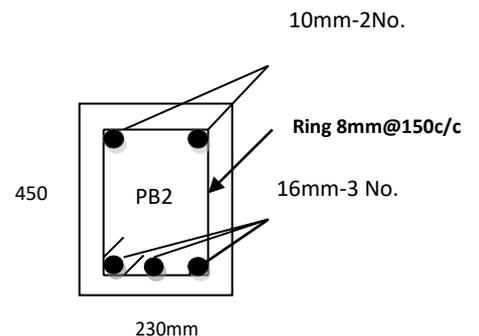

We Calculate Reinforcement of Plinth Beam PB2

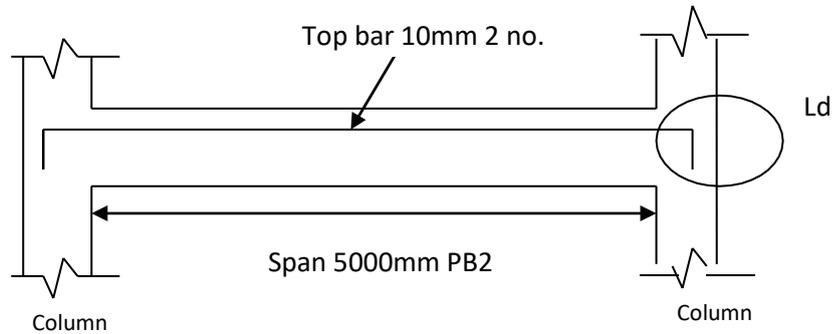

Given.

- Clear Span of Beam = 5000 mm
- Development Length L_d = 40d
- Clear Cover = 25 mm assume
- Bottom = 3 numbers of 16mm
- Top = 2 numbers of 10mm
- Stirrups = 8mm @ 150mm
- No of PB2 BEAM = 2

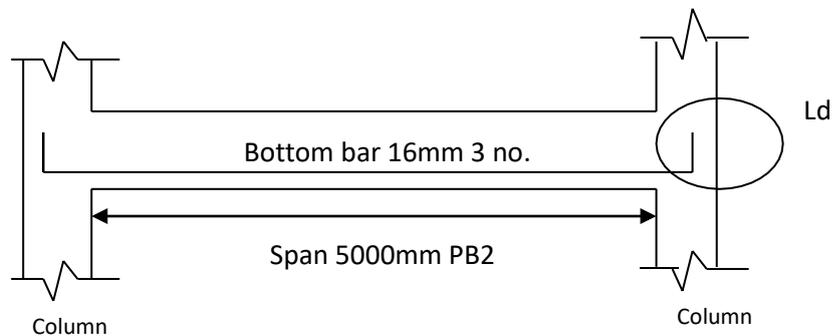

Step 1 : Find cutting length of Main top bar

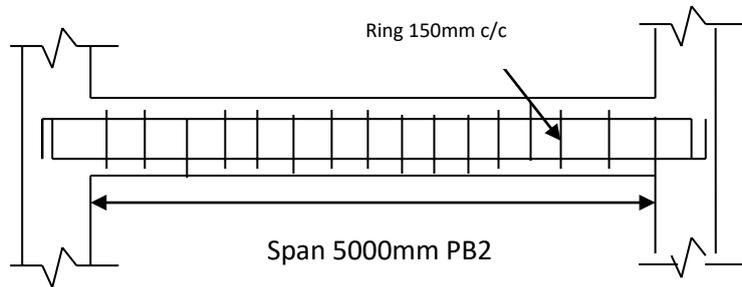

$$\begin{aligned}\text{Cutting length of top bar} &= \text{Clear Span} + 2 \times \text{Development length}(L_d) - (2 \text{ bend } 90\text{deg}) \\ &= 5000 + (2 \times 40d) - (2 \times 2d) \\ &= 5000 + (2 \times 40 \times 10) - (2 \times 2 \times 10) \\ &= 5760 \text{ mm}\end{aligned}$$

Step 2 : Find cutting length of Main Bottom bar

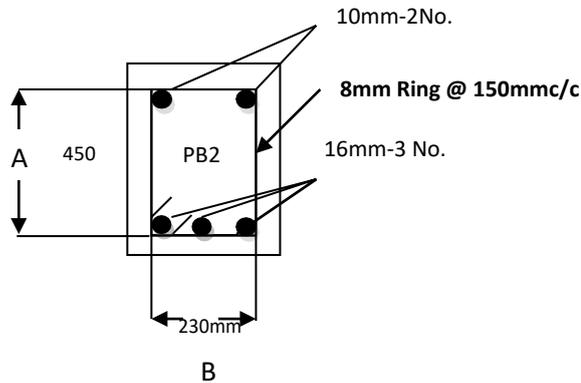

$$\begin{aligned}\text{Cutting length of Bottom bar} &= \text{Clear Span} + 2 \times \text{Development length}(L_d) - (2 \text{ bend } 90\text{deg}) \\ &= 5000 + (2 \times 40d) - (2 \times 2d) \\ &= 5000 + (2 \times 40 \times 16) - (2 \times 2 \times 16) \\ &= 6216 \text{ mm}\end{aligned}$$

Step 3 : Find Out No. Of Ring in Beam.

Number of Stirrups required = (Clear Span of Beam/Spacing Stirrups)+ 1
 = (5000 / 150) +1 = **34 No.s**

Step 4 – Find out cutting length of Stirrup

Length of One Hook = **9d**

Calculation of A = 450 – 25 – 25 – 4 – 4 = 392

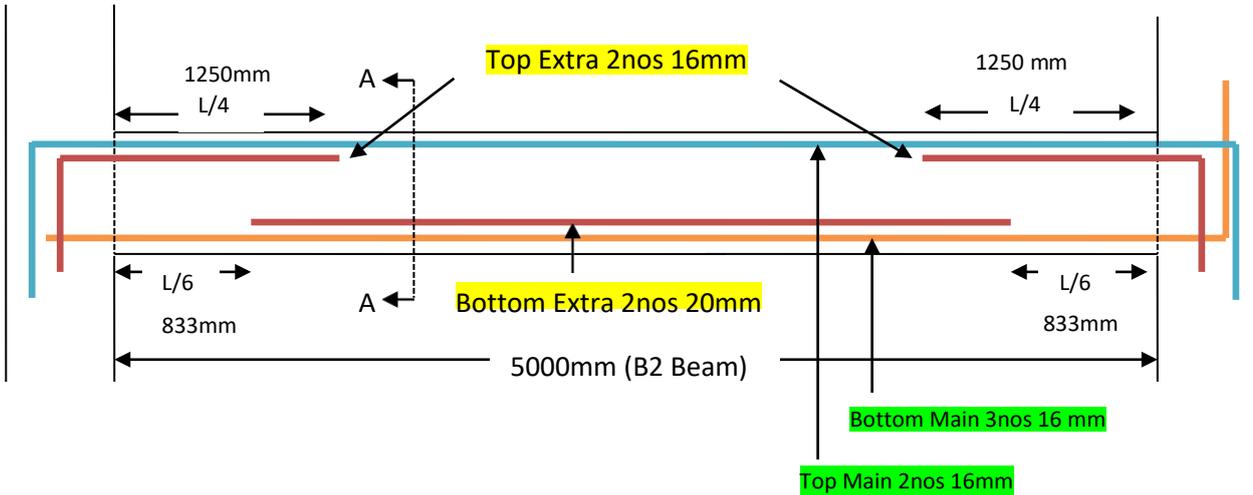

Calculation of B = 230 – 25 – 25 – 4 – 4 = 172

Cutting length of Stirrup = Perimeter of stirrup + No. Of Hook – Bend Deduction 90/135deg

= 2(A+B) + (2x9d **Hook**)-(3x2d **90Deg Bend**)-(2x3d **135 Deg Bend**)
 = 2(392+172) + (2x9x8) - (3x2x8) - (2x3x8)
 = **1176 mm**

Bar Banding Schedule For Beam With Extra Bar

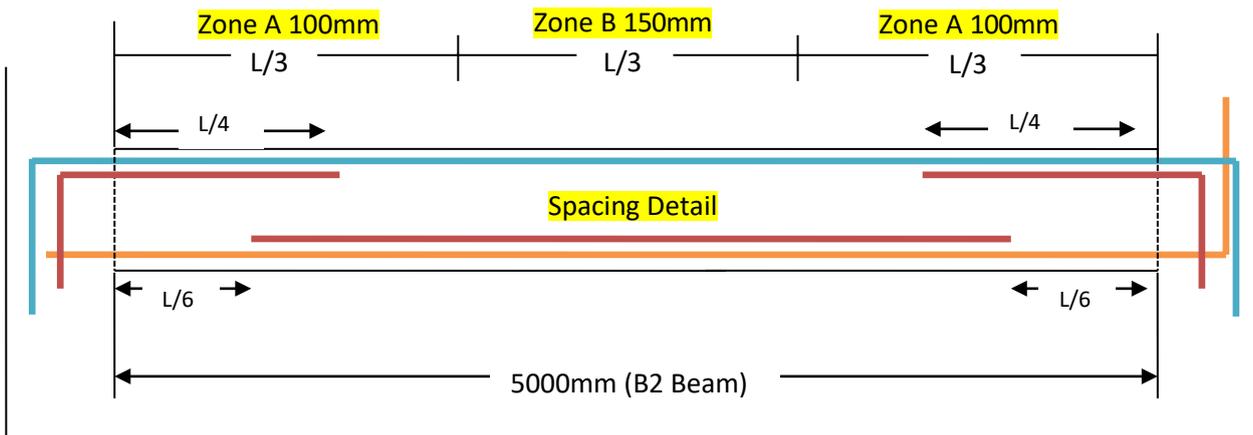

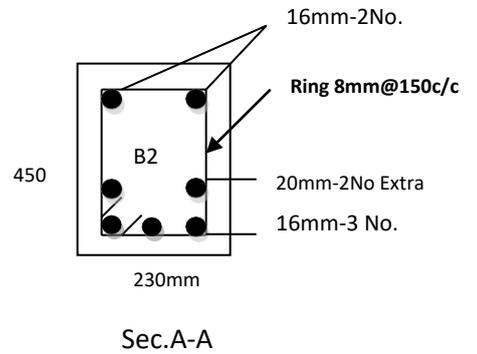

Suppose Same Drawing Span Related to Plinth Beam Drawing, then how to find BBS

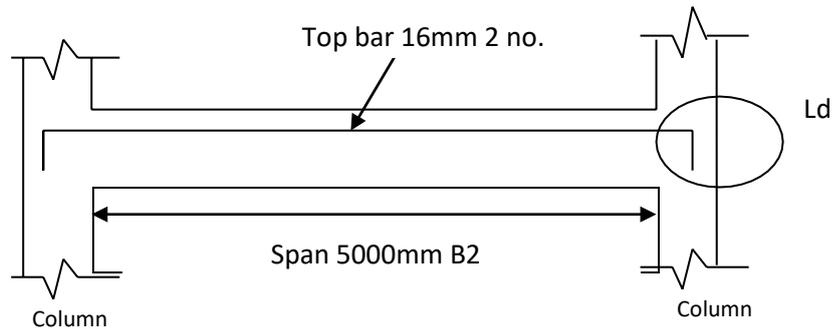

Given.

- Clear Span of B2 Beam = 5000 mm
- Development Length L_d = $40d$
- Clear Cover = 25 mm assume
- Bottom Main = 3 nos 16mm
- Bottom Extra = 2 nos 20mm
- Top Main = 2 nos of 16mm
- Top Extra = 2nos 16mm

- Stirrups = 8mm @ 100mm at Support ,,150mm at mid
- Number of Beam B2 = 2

Step 1 : Find cutting length of Main top bar

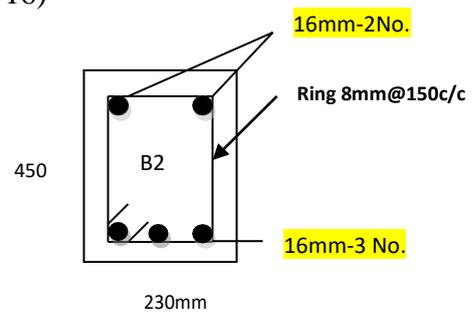

Cutting length of top bar = Clear Span + 2 x Development length(Ld) – (2 bend 90deg)

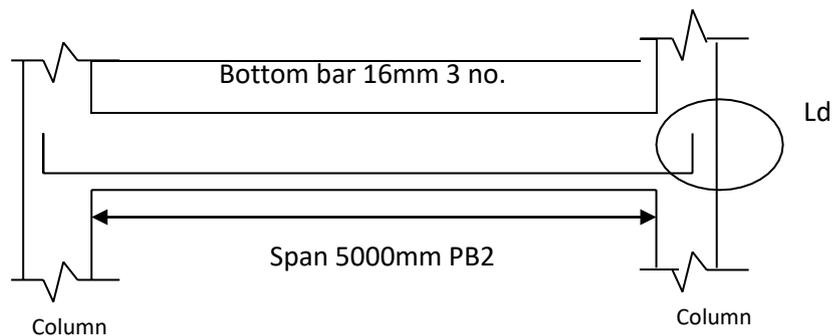

$$= 5000 + (2 \times 40d) - (2 \times 2d)$$

$$= 5000 + (2 \times 40 \times 16) - (2 \times 2 \times 16)$$

$$= 6216 \text{ mm}$$

Step 2 : Find cutting length of Main Bottom bar

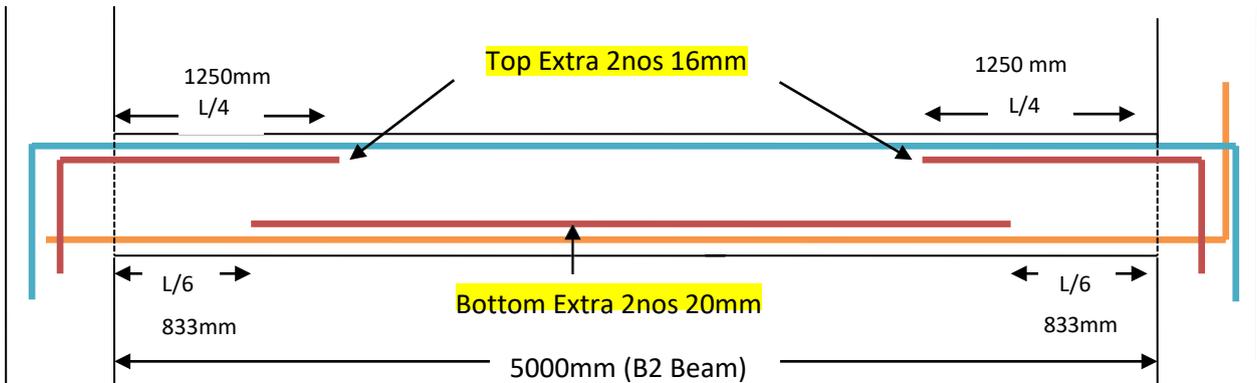

Cutting length of Bottom bar = Clear Span + 2 x Development length(Ld) – (2 bend 90deg)

$$= 5000 + (2 \times 40d) - (2 \times 2d)$$

$$= 5000 + (2 \times 40 \times 16) - (2 \times 2 \times 16)$$

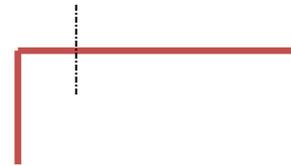

$$= 6216 \text{ mm}$$

Step 3 : Find cutting length of Main top Extra bar

Cutting length of top Extra bar = $L/4$ Span + Development length(L_d) – (1 bend 90deg)

$$\begin{aligned}
 &= (5000/4) + (40d) - (1 \times 2d) \\
 &= 1250 + (40 \times 16) - (2 \times 16) \\
 &= 1858 \text{ mm}
 \end{aligned}$$

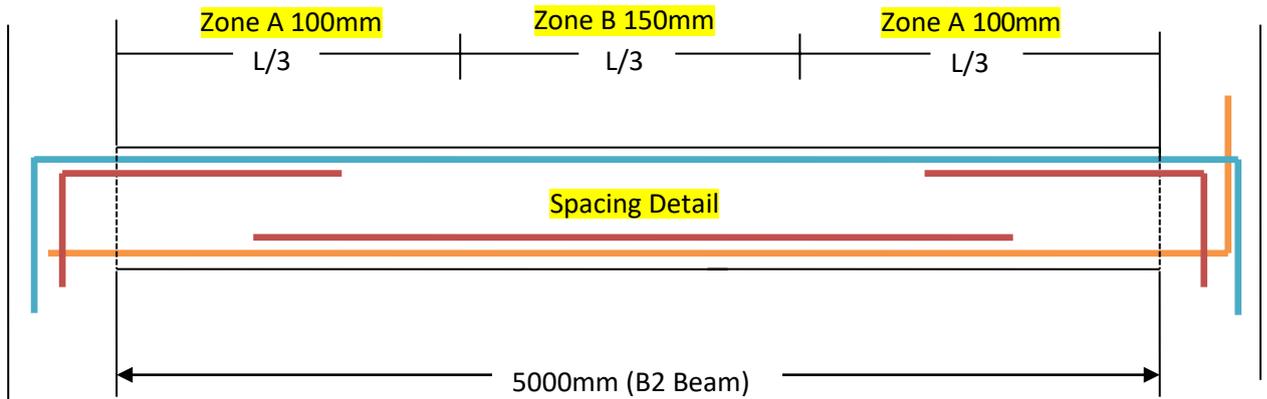

Step 3 : Find cutting length of Bottom Extra bar

Cutting length of top Extra bar = Total Span – $L/6$ Span Both Side

$$\begin{aligned}
 &= 5000 - (2 \times 5000/6) \\
 &= 5000 - (2 \times 833) \\
 &= 5000 - 1666 \\
 &= 3334 \text{ mm}
 \end{aligned}$$

Step 3 : Find Out No. Of Ring in Beam.

For Zone A

$$\text{Distance of Zone A} = L/3 = 5000/3 = 1666\text{mm}$$

$$\begin{aligned} \text{No. Of Ring in Zone A} &= (\text{Distance of Zone A})/\text{Spacing} + 1 \\ &= 1666/100 + 1 \\ &= 18 \text{ nos} \times 2 \text{ Side} \\ &= \mathbf{36 \text{ Nos}} \end{aligned}$$

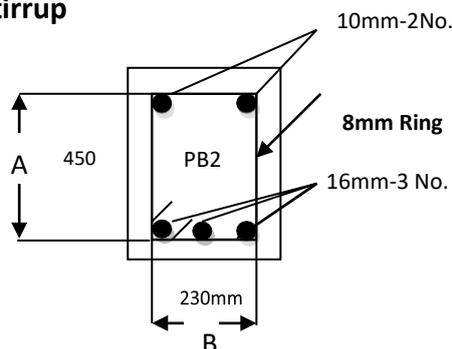

For Zone B

$$\text{Distance of Zone B} = L/3 = 5000/3 = 1666\text{mm}$$

$$\begin{aligned} \text{No. Of Ring in Zone B} &= (\text{Distance of Zone B})/\text{Spacing} + 1 \\ &= 1666/150 + 1 \\ &= \mathbf{12 \text{ Nos}} \end{aligned}$$

$$\text{Total No of Ring} = 36 + 12 = 48 \text{ Ring}$$

Step 4 – Find out cutting length of Stirrup

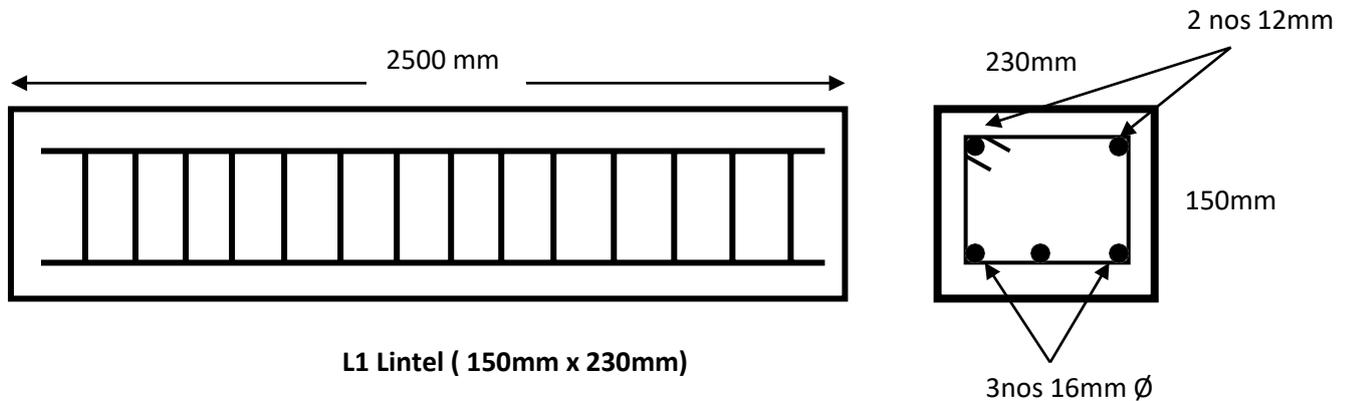

Length of One Hook = **9d**

$$\text{Calculation of A} = 450 - 25 - 25 - 4 - 4 = 392$$

$$\text{Calculation of B} = 230 - 25 - 25 - 4 - 4 = 172$$

$$\begin{aligned} \text{Cutting length of Stirrup} &= \text{Perimeter of stirrup} + \text{No. Of Hook} - \text{Bend Deduction}_{90/135\text{deg}} \\ &= 2(A+B) + (2 \times 9d \text{ Hook}) - (3 \times 2d \text{ 90Deg Bend}) - (2 \times 3d \text{ 135 Deg Bend}) \\ &= 2(392+172) + (2 \times 9 \times 8) - (3 \times 2 \times 8) - (2 \times 3 \times 8) \\ &= \mathbf{1176 \text{ mm}} \end{aligned}$$

BAR BENDING SCHEDULE OF LINTEL BEAM

Given

Length of Lintel (L1)	= 2500 mm
Clear Cover	= 25 mm
Dimension of Lintel	= 230 x 150mm
Stirrups	= 8mm \emptyset @ 125 c/c
Top Reinforcement	= 12 mm \emptyset 2 nos
Bottom Reinforcement	= 16 mm \emptyset 3 nos
Number Of L1 Lintel	= 10

Step 1. Cutting Length Of Top Bars

$$\begin{aligned}\text{Length of Top bar} &= \text{Length of lintel} - \text{clear cover for both sides} \\ &= 2500 - 2 \times 25 \text{ [Clear cover for both sides]} \\ &= 2450 \text{ mm} \\ &= 2.4 \text{ m.}\end{aligned}$$

Step 2. Cutting Length Of Bottom Bars

$$\begin{aligned}\text{Length of Bottom bar} &= \text{Length of lintel} - \text{clear cover for both sides} \\ &= 2500 - 2 \times 25 \text{ [Clear cover for both sides]} \\ &= 2450 \text{ mm} = 2.4 \text{ m}\end{aligned}$$

Step 3. Cutting Length Of Stirrups:

$$a = 230 - 25 - 25 - 8 = 172 \text{ mm}$$

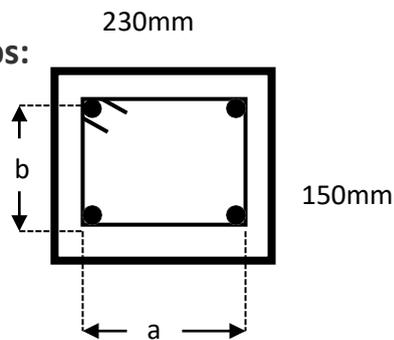

$$b = 150 - 25 - 25 - 8 = 84 \text{ mm.}$$

Cutting length of stirrups = $2(a+b)$ + Hooks Length – Bend

Hooks length = $10d$

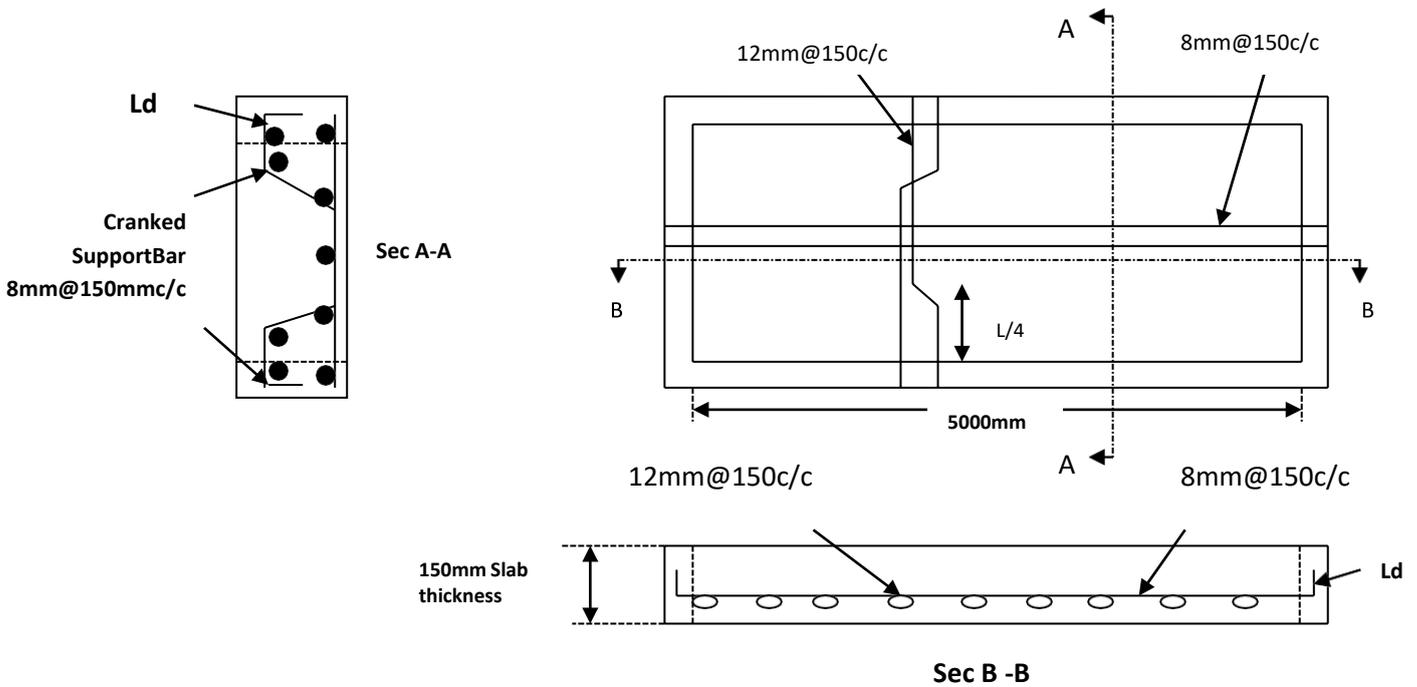

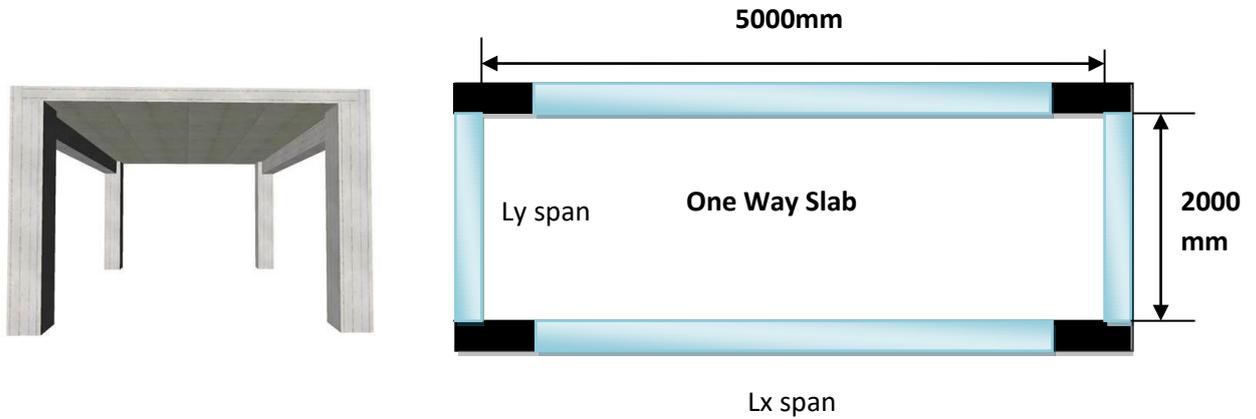

$$\begin{aligned} \text{Cutting length of stirrups} &= 2(a+b) + 2 \times 10 \times 8 - (3 \times 2 \times 8 \text{ 90 deg}) - (2 \times 3 \times 8 \text{ 135 deg}) \\ &= 2(172 + 82) + 160 - 48 - 48 \\ &= \mathbf{572 \text{ mm}} \end{aligned}$$

Step 4. Calculate No Of Stirrups:

$$\begin{aligned} \text{No of stirrups} &= \{(\text{Total length of lintel}) / (\text{c/c distance between stirrups})\} + 1 \\ &= (2500 / 125) + 1 \\ &= \mathbf{21} \end{aligned}$$

Bar Bending Schedule For One Way Slab

Given

- Main bars = 12 mm @ 150 mm c/c spacing
- Distribution bars = 8 mm @ 150 mm c/c spacing.
- Cranked support bar = 8mm @ 150 mm c/c spacing.
- Top and Bottom. Clear Cover = 25 mm
- Development length = 40 d
- Slab Thickness = 150 mm
- See Slab Section

Bar Bending Schedule Calculation for One Way Slab

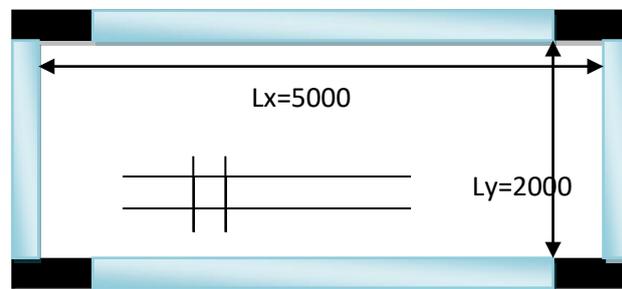

Step 1... Calculate Number Of Bar in slab

Number of Bars Formula = (Length / spacing) + 1

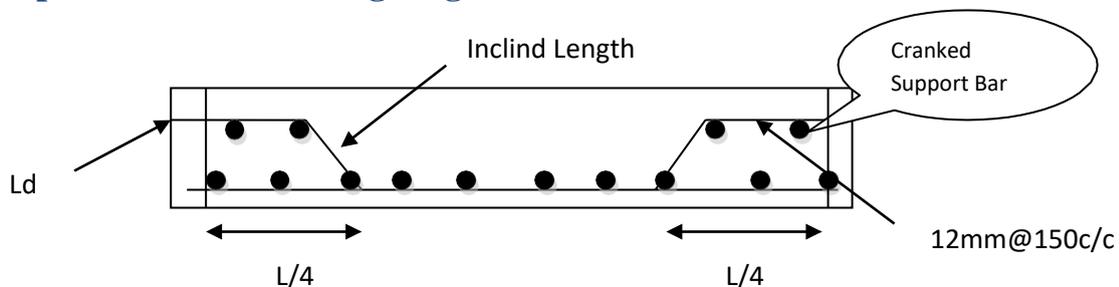

Number of Main Bars = $(L_x / \text{spacing}) + 1 = (5000/150) + 1 = 34 \text{ nos}$

Number of Distribution Bars = $(L_y / \text{spacing}) + 1 = (2000 / 150) + 1 = 14 \text{ nos}$

s

Step 2...Calculate cutting length

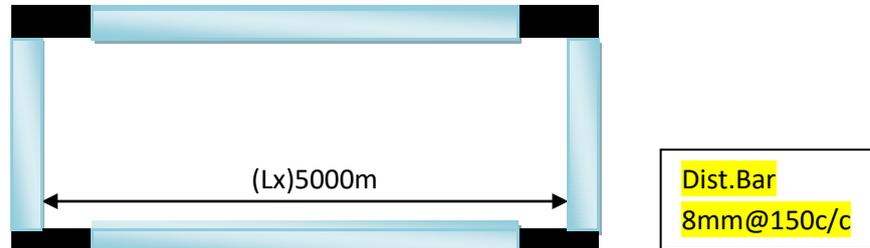

Cutting Length of Main Bar,

= Clear Span of Slab (L_y) + (2 X Development Length) + (1 x Inclined length)
 - (45° bend x 2) - (90° bend x 2)

We know that one side Crank Length = $0.42 D$,
 = $2000 + (2 \times 40 \times 12) + (1 \times 0.42 \times D) - (1d \times 2) - (2d \times 2)$
 = $2000 + 960 + 0.42D - (1 \times 12 \times 2) - (2 \times 12 \times 2)$
 = $2960 + 0.42D - 24 - 48$
 = $2960 + (0.42 \times 88) - 24 - 48$
 = $2925 \text{ mm or } 2.92 \text{ m}$

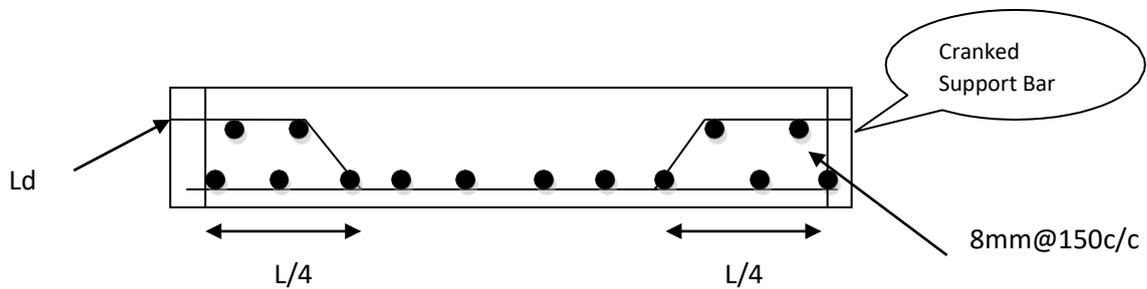

$D = \text{Slab thickness} - 2 \text{ side clear cover} - \text{dia of bar}$
 = $150 - 50 - 12 = 88 \text{ mm}$

Cutting length of distribution bar

$$\begin{aligned}
 &= \text{Clear Span (Lx)} + (2 \times \text{Development Length (Ld)}) - (90^\circ \text{ bend} \times 2) \\
 &= 5000 + (2 \times 40 \times 8) - (2 \times 8 \times 2) \\
 &= 5608 \text{ mm or } 5.60 \text{ m}
 \end{aligned}$$

Step 3..Number of Bar required for BothSide Cranked Support Bar.

Drawing section A-A

$$\begin{aligned}
 \text{Number of top bars} &= (L_y/4) / \text{spacing} + 1 \\
 &= (2000/4) / 150 + 1 \\
 &= 4 \text{ Nos} \times 2 \text{ sides}
 \end{aligned}$$

$$\text{Number of top bars} = 8 \text{ Nos bar}$$

$$\text{Length of Cranked Support Bar (L)} = \text{Same as distribution bars} = 5.60 \text{ m}$$

Bar Bending Schedule For two Way Slab

Is it two way slab ?

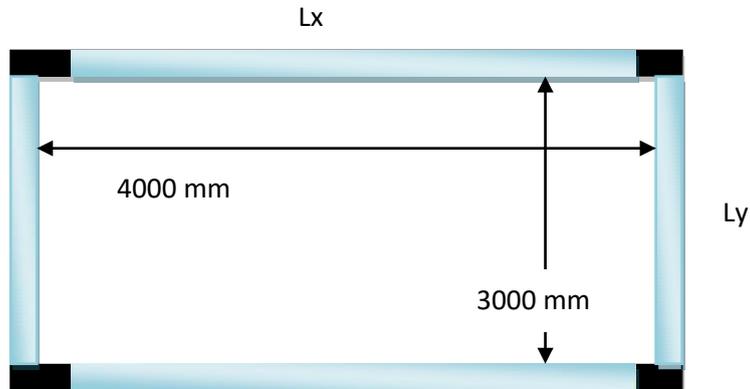

Two Way Slab

$$=(L_x/l_y) < 2$$

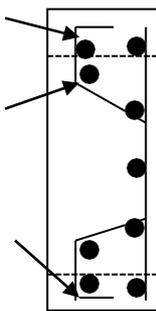

$$=(4000/3000) < 2$$

$$=1.33 < 2$$

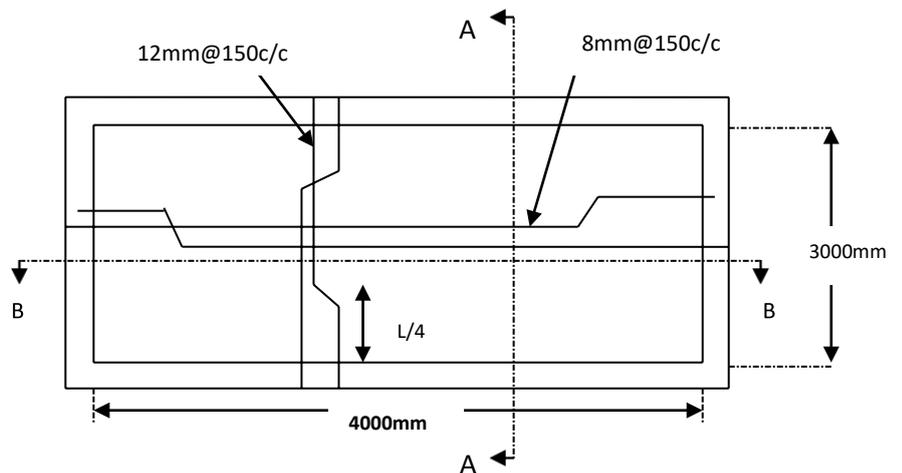

This is Two Way Slab

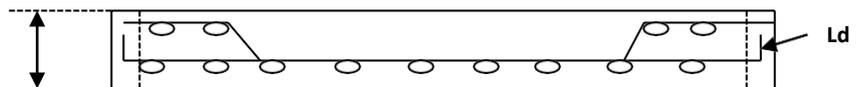

Ld
Cranked Support Bar
8mm@150mm/c

Sec A-A

150mm Slab thickness

Sec B -B

Given

- Main bars 12 mm @ 150 mm c/c spacing
- Distribution bars 8 mm @ 150 mm c/c spacing.
- Cranked support bar 8mm/10mm @ 150 mm c/c spacing.
- Top and Bottom Clear Cover is 25 mm
- Development length 40 d
- Slab Thickness – 150 mm
- See Slab Section

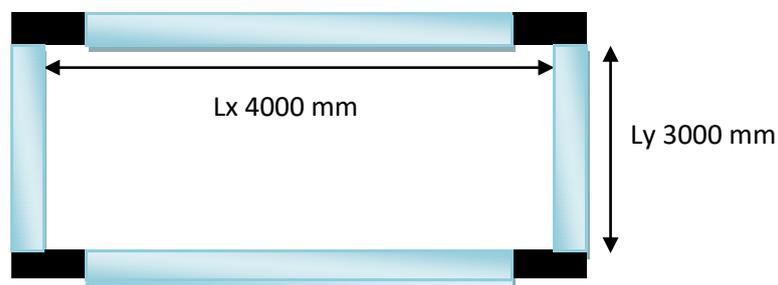

Bar Bending Schedule Calculation for Two Way Slab

Step 1... Calculate Number Of Bar

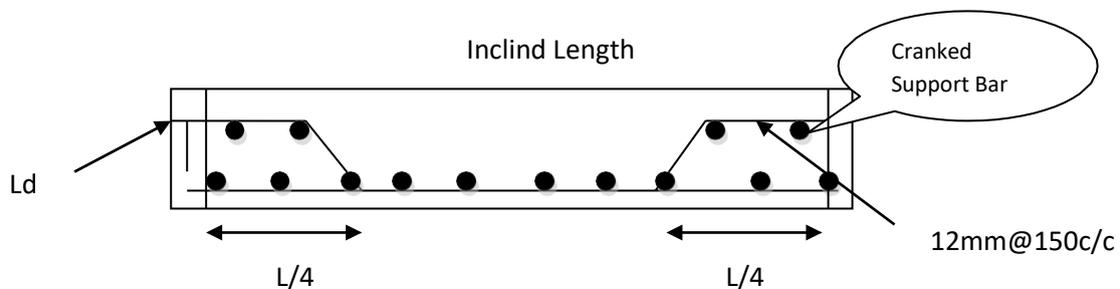

Number of Bars Formula = (Length of slab / spacing) + 1

Number of Main Bars = $(L_x / \text{spacing}) + 1 = (4000/150) + 1 = 27 \text{ nos}$

Number of Distribution Bars = $(L_y / \text{spacing}) + 1 = (3000 / 150) + 1 = 21 \text{ nos}$

Step 2...Calculate cutting length

Cutting Length of Main Bar,

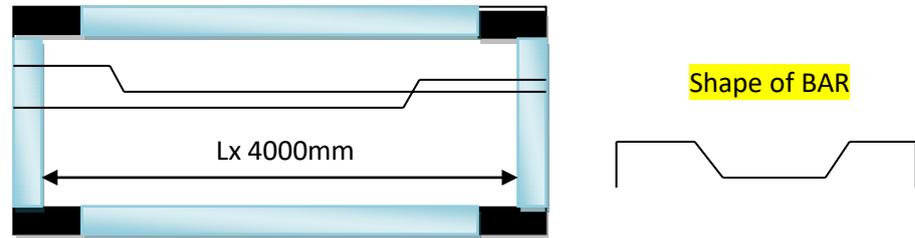

= Clear Span of Slab (L_y) + (2 X Development Length) + (1 x inclined length) - (45° bend x 2) - (90° bend x 2)

we know that one side crank inclined length is $0.42D$,
 $= 3000 + (2 \times 40 \times 12) + (1 \times 0.42 \times D) - (1d \times 2) - (2d \times 2)$
 $= 3000 + 960 + 0.42D - (1 \times 12 \times 2) - (2 \times 12 \times 2)$
 $= 3480 + 0.42D - 24 - 48$
 $= 3960 + (0.42 \times 88) - 24 - 48$

$D = \text{Slab thickness} - 2 \text{ side clear cover} - \text{dia of bar}$
 $= 150 - 50 - 12 = 88 \text{ mm}$

Cutting Length of Main Bar = 3925 mm or 3.92 m

cutting length of distribution bar

$$= \text{Clear Span of Slab (Lx)} + (2 \times \text{Development Length}) + (1 \times \text{inclined length}) - (45^\circ \text{ bend} \times 2) - (90^\circ \text{ bend} \times 2)$$

we know that one side crank inclined length is $0.42D$

$$= 4000 + (2 \times 40 \times 8) + (1 \times 0.42 \times D) - (1d \times 2) - (2d \times 2)$$

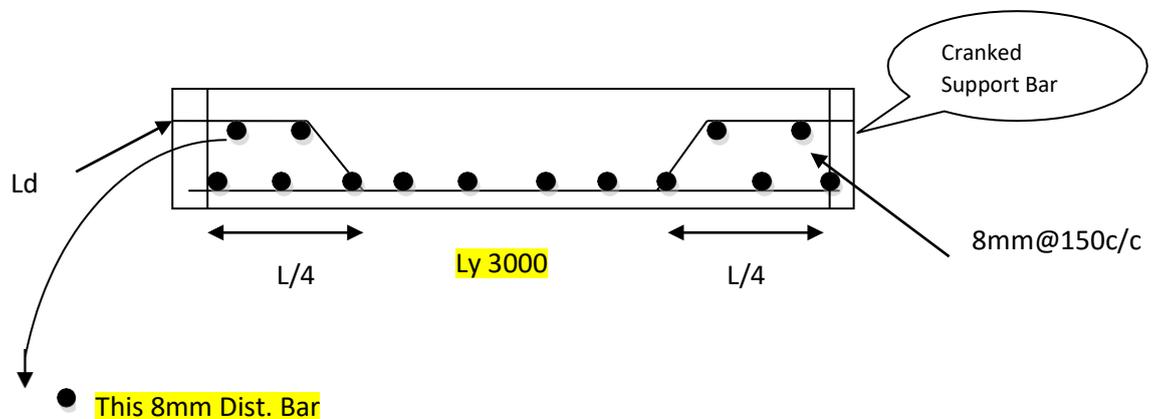

$$= 4000 + 320 + (0.42 \times 88) - (1 \times 8 \times 2) - (2 \times 8 \times 2)$$

$$= 4612 \text{ mm or } 4.61 \text{ m}$$

$$D = \text{Slab thickness} - 2 \text{ side clear cover} - \text{dia of bar}$$

$$= 150 - 50 - 12 = 88 \text{ mm}$$

Step 3 Calculate Top Bar (Extra) ; Top Bars are provided at the top of critical length ($L/4$) area, Please refer the drawing section A-A

8mm distribution cranked support bar

$$\text{Number of Top bars on Lx side} = (Ly/5) / \text{spacing} + 1 = (3000/5) / 150 + 1$$

$$= 5 \text{ Nos} \times 2 \text{ side}$$

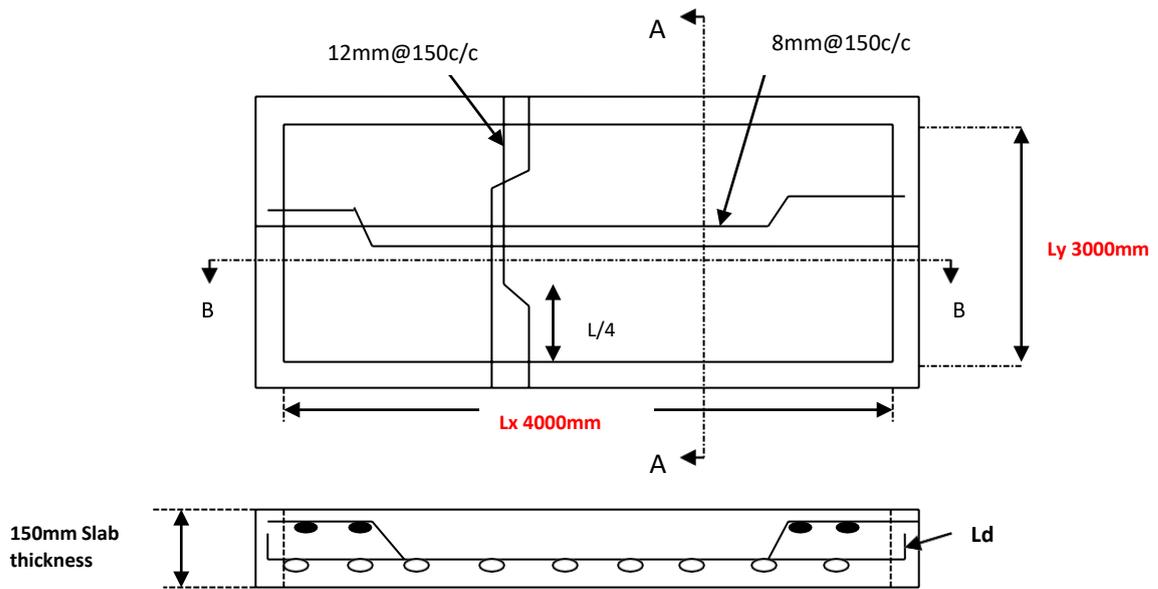

$$= 10 \text{ nos}$$

Length of top bar on Ly side = Clear Span of Slab (Ly) + (2 X Development Length) - (90° bend x 2)

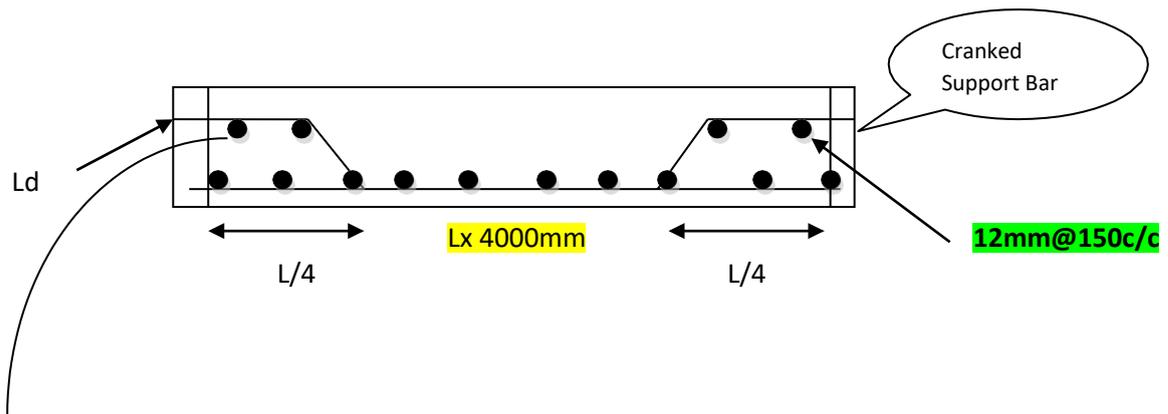

$$= 4000 + (2 \times 40 \times 8) - (2 \times 8 \times 2)$$

$$= 4000 + 640 - 32$$

$$= 4608 \text{ mm or } 4.60 \text{ m}$$

Section B - B

● This 12mm bar Calculation

12mm main cranked support bar

$$\begin{aligned}
 \text{Number of Top bars on Ly side} &= (Lx/5) / \text{spacing} + 1 \\
 &= (4000/5) / 150 + 1 \\
 &= 6 \text{ Nos} \times 2 \text{ side} \\
 &= 12 \text{ nos}
 \end{aligned}$$

$$\begin{aligned}
 \text{Length of top bar on Ly side} &= \text{Clear Span of Slab (Ly)} + (2 \times \text{Development Length}) \\
 &\quad - (90^\circ \text{ bend} \times 2)
 \end{aligned}$$

$$\begin{aligned}
 &= 3000 + (2 \times 40 \times 12) - (2 \times 12 \times 2) \\
 &= 3000 + 960 - 48 \\
 &= 3912 \text{ mm or } 3.91 \text{ m}
 \end{aligned}$$
